**KEY WORDS:** Nearctic region, North America, catalogue, type, *Ctenophion*, *Phradis*, parasitoids.

**КЛЮЧЕВЫЕ СЛОВА:** Неарктика, Северная Америка, каталог, тип, *Ctenophion*, *Phradis*, паразитоиды.

**ABSTRACT.** Illustrated catalogue of North American species of genera *Ctenophion* Horstmann, 2010 (1 species) and *Phradis* Förster, 1869 (20 species) is provided. Colour photographs of holotypes of 18 species of *Phradis* are given for the first time.

**РЕЗЮМЕ.** Дан иллюстрированный каталог североамериканских видов родов *Ctenophion* Horstmann, 2010 (1 вид) и *Phradis* Förster, 1868 (20 видов). Цветные фотографии голотипов 18 видов *Phradis* публикуются впервые.

## Introduction

First North American species of the genus *Phradis* Förster, 1869, *P. kasparyani* Khalaim, 2002, was described by Khalaim [2002] from California. Horstmann [2013] revised the Nearctic fauna of the genus, described 17 new species from Canada and USA, and provided an identification key to 18 Nearctic species. Recently, two rare species, *Phradis bufalosus* Khalaim et Ruíz-Cancino, 2018 and *P. nanacamilpus* Khalaim et Ruíz-Cancino, 2018, were discovered from Central Mexico [Khalaim, Ruíz-Cancino, 2018]. Thus, the North American fauna of the genus currently comprises 20 known species; of them 18 species described before 2018 were illustrated only by scarce contour figures. The genus *Ctenophion* Horstmann, 2010 was described for one species, *C. niger* Horstmann, 2010, which was also scarcely illustrated only by contour figures.

The aim of this work is to give a catalogue of Nearctic species of *Ctenophion* and *Phradis* with data on holotype and general distribution to each species, and provide high quality colour photographs taken primarily from holotypes.

## Material and Methods

Following acronyms of depositories are used in this work: AEIC — Townes et Dasch collections (former American Entomological Institute), recently moved to the Utah State University, Logan, Utah, USA; CNC — Canadian National Collection of Insects, Ottawa, Ontario, Canada; ESUW — University of Wyoming, Laramie, Wyoming, USA; TAMU — Texas A&M University, College Station, Texas, USA; UNAM — Instituto de Biología, Universidad Nacional Autónoma de México, D.F., Mexico; ZIN — Zoological Institute RAS, St Petersburg, Russia; ZSM — Zoologische Staatssammlung, Munich, Germany.

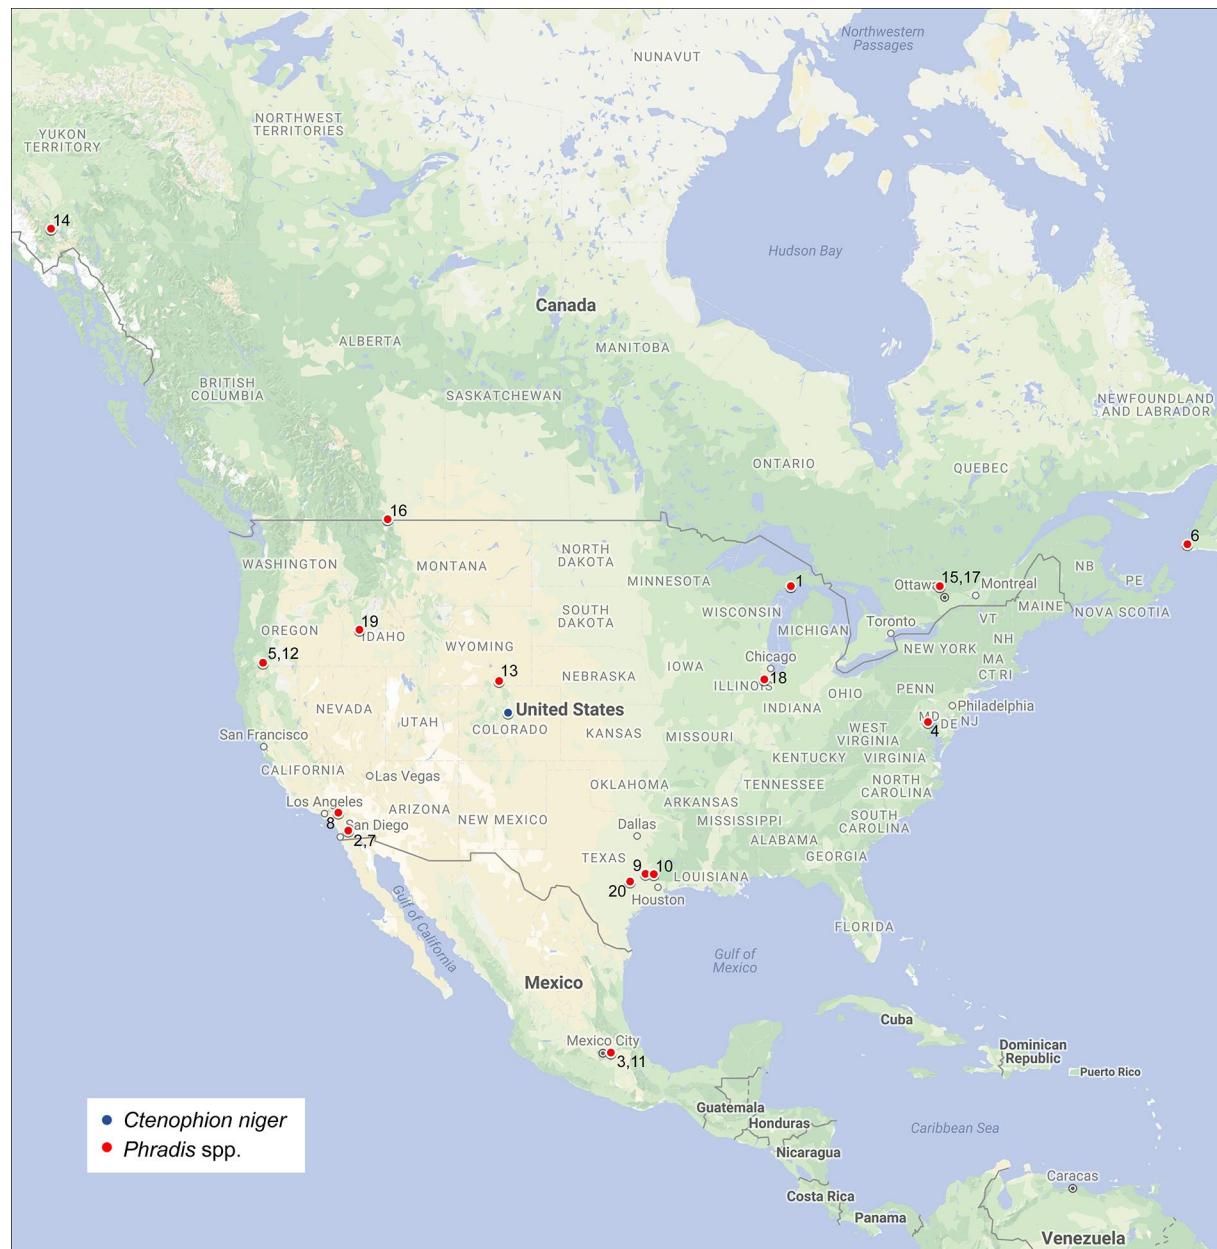

Paratype of *C. niger* and holotypes of 17 species of *Phradis* were examined and photographed using a digital camera Nikon 1 V3 + Leica Z16 APO + Leica Planaro 1.0x / WD 97 mm during my visit to the ZSM in May 2016; these specimens (except paratype of *C. niger* belonging to ZSM) are temporary stored in the ZSM and will be returned to USA and Canadian collections. Photographs of *P. kasparyani* (Figs 35–40) were taken in the ZIN with a Canon EOS 70D digital camera attached to an Olympus SZX10 stereomicroscope, and partially focused images were combined using Helicon

Focus Pro software. Map of North America with type localities (Fig. 1) was generated from the Google Maps service (<https://www.google.com/maps/>); supplementary kmz-file containing detailed geographic data is enclosed.

Countries and regions in *Distribution* sections are listed in alphabetical order. Non-type males and specimens of *Phradis* mentioned by Horstmann [2010] in *Variation* sections are included to general distribution as doubtful (with a question mark "?").

## Results

Illustrated catalogue of the Nearctic species of the genera *Ctenophion* (one species) and *Phradis* (20 species) is given. Colour photographs are provided for the single species of *Ctenophion* and 18 species of *Phradis*; photographs of two species, *P. bufalosus* and *P. nancamilpus*, recently described from Mexico are not included because these two species were well illustrated in the original publication [Khalaim, Ruiz-Cancino,

Figs 1. Map of North America with type localities of *Ctenophion* and *Phradis* species. Numbers of localities in the map correspond with those of *Phradis* species in the catalogue.

Рис. 1. Карта Северной Америки с типовыми локациями видов *Ctenophion* и *Phradis*. Номера точек на карте соответствуют номерам видов *Phradis* в каталоге.

2018]. Type localities of *Ctenophion niger* and 20 species of *Phradis* are presented in the map (Fig. 1); see supplementary kmz-file for detailed geographic data.

**Genus *Ctenophion* Horstmann, 2010**

Type species: *Ctenophion niger* Horstmann, 2010.

**DESCRIPTION.** Relatively large species with body length 4.0–5.5 mm. Head, in dorsal view, with gena roundly tapered

behind eyes, almost as long as eye width. Antennal flagellum long, filiform, with 24–25 flagellomeres; several subbassal flagellomeres bear distinct finger-shaped structures on outer side near apex. Mandible with upper tooth about as long as lower tooth. Malar space longer than basal mandibular width. Clypeus broad, lenticular. Hypostomal carina obliterated.

Notaulus distinct, with irregular wrinkles. Epicnemial carina with upper end bent forwards and reaching front

Figs 2–8. *Ctenophion niger*, paratype female: 2 — antennae, lateral view; 3 — head, front view; 4 — head, dorsal view; 5 — head and mesosoma, lateral view; 6 — propodeum, dorsolateral view; 7 — hind leg, lateral view; 8 — apex of metasoma with ovipositor, lateral view.

Рис. 2–8. *Ctenophion niger*, паратип, самка: 2 — антенны, сбоку; 3 — голова, спереди; 4 — голова, сверху; 5 — голова и мезосома, сбоку; 6 — проподеум, сверху и сбоку; 7 — задняя нога, сбоку; 8 — вершина метасомы с яйцекладом, сбоку.

margin of mesopleuron slightly below middle of posterior margin of pronotum. Foveate groove broad and coarse, somewhat upcurved anteriorly, extending from epicnemial carina to base of mid coxa. Propodeum with coarse irregular rugae (Fig. 6). Propodeal spiracle round, separated from pleural carina by about 3.0 times its own diameter.

Fore wing with second recurrent vein (2m-cu) interstitial, intercubitus (2rs-m) unusually long. First and second sections of radius (Rs+2r and Rs) meeting at obtuse angle. Second abscissa of postnervulus present, thus brachial cell is closed posteriorly. Hind wing with nervellus (cu1&cu-a) nearly vertical.

Legs slender. Hind leg with tibia much longer than femur; basitarsus short, about 0.4 times as long as tibia (Fig. 7). Longer hind tibial spur almost straight, with distal end slightly curved. Tarsal claws distinctly pectinate.

Metasomal tergite 1 robust, depressed; glymma deep, situated in centre of first tergite, joining by furrow with ventral part of postpetiole; petiole entirely striate laterally before glymma. Ovipositor very short and robust, upcurved, with shallow dorsal subapical depression (Fig. 8).

**COMPOSITION.** One species described from the Nearctic region and recently recorded from North Europe [Khaim, Várkonyi, 2018].

Figs 9–13. *Phradis basalis*, holotype female: 9 — habitus, lateral view; 10 — head with antennae, lateral view; 11 — head and mesosoma, lateral view; 12 — propodeum, dorsal view; 13 — metasoma with ovipositor, lateral view.

Рис. 9–13. *Phradis basalis*, голотип, самка: 9 — габитус, сбоку; 10 — голова с антеннами, сбоку; 11 — голова и мезосома, сбоку; 12 — проподеум, сверху; 13 — метасома с яйцекладом, сбоку.

Figs 14–18. *Phradis brevicauda*, holotype female: 14 — habitus, lateral view; 15 — head with antennae, anterolateral view; 16 — head and mesosoma, lateral view; 17 — propodeum, dorsal view; 18 — metasoma with ovipositor, lateral view.

Рис. 14–18. *Phradis brevicauda*, голотип, самка: 14 — габитус, сбоку; 15 — голова с антеннами, спереди и сбоку; 16 — голова и мезосома, сбоку; 17 — проподеум, сверху; 18 — метасома с яйцекладом, сбоку.

MATERIAL EXAMINED. Canada, Alberta, Sunwapta Pass, Banff National Park, 7400 ft. (= 2260 m), 1.VIII.1962, coll. W.R.M. Mason, 1 ♀ (paratype, ZSM).

DISTRIBUTION. Canada (Alberta, Yukon), USA (Alaska, Colorado), Finland (north).

Genus *Phradis* Förster, 1869

Type species: *Thersilochus (Phradis) brevis* Brischke, 1880.

DESCRIPTION. Small and medium sized species with body length usually between 2.5 and 4.0 mm, thought largest species of the genus, e.g. *P. gibbus* (Holmgren, 1860) and *P. longibasalis* Khalaim, 2007, may have body length over 6.0 mm.

Figs 19–23. *Phradis coriaceus*, holotype female: 19 — habitus, lateral view; 20 — head with antennae, lateral view; 21 — head and mesosoma, lateral view; 22 — propodeum, dorsal view; 23 — apex of metasoma with ovipositor, lateral view.

Рис. 19–23. *Phradis coriaceus*, голотип, самка: 19 — габитус, сбоку; 20 — голова с антеннами, сбоку; 21 — голова и мезосома, сбоку; 22 — проподеум, сверху; 23 — вершина метасомы и яйцеклад, сбоку.

Head, in dorsal view, usually with gena roundly tapered behind eyes, 0.5–1.1 times as long as eye width. Antennal flagellum filiform or weakly clavate, sometimes very slender basally, with 8 to 24 flagellomeres; Nearctic *P. curvicauda* Horstmann, 2013 (Fig. 25) and *P. flavipes* Horstmann, 2013 (Fig. 33), and Palaearctic *P. decameron* Khalaim, 2004, possess flagellum with 7–9 flagellomeres, it is a

minimum number of flagellomeres known in the family Ichneumonidae. Some flagellomeres bear more or less distinct finger-shaped structures on outer side near apex of each flagellomere [see Khalaim et al., 2009]. Mandible with upper tooth usually longer than lower tooth, but in several species (e.g. *P. nigritulus* (Gravenhorst, 1829), *P. toreador* Aubert, 1986) the lower tooth is longer. Clypeus lenticular,

Figs 24–28. *Phradis curvicauda*, holotype female: 24 — habitus, lateral view; 25 — head with antennae, lateral view; 26 — head and mesosoma, lateral view; 27 — propodeum, dorsal view; 28 — apex of metasoma with ovipositor, lateral view.

Рис. 24–28. *Phradis curvicauda*, голотип, самка: 24 — габитус, сбоку; 25 — голова с антеннами, сбоку; 26 — голова и мезосома, сбоку; 27 — проподеум, сверху; 28 — вершина метасомы с яйцекладом, сбоку.

Figs 29–31. *Phradis flavicoxa*, holotype female: 29 — habitus, lateral view; 30 — head with antennae, lateral view; 31 — metasoma with ovipositor, lateral view.

Рис. 29–31. *Phradis flavicoxa*, голотип, самка: 29 — габитус, сбоку; 30 — голова с антеннами, сбоку; 31 — метасома с яйцекладом, сбоку.

sometimes slightly truncated apically, with a transverse row of bristles near its lower margin. Hypostomal carina usually absent.

Notaulus usually with short wrinkle on anterolateral side of mesoscutum. Epicnemial carina with upper end bent forwards and reaching front margin of mesopleuron at level of lower 0.4–0.5 of pronotum. Foveate groove of mesopleuron horizontal or weakly upcurved anteriorly, short and thin, or as weakly impressed area with transverse or irregular wrinkles, or completely absent. Propodeum usually with a pair of median longitudinal carinae bounding short basal area laterally (Figs 12, 17, 22, 27, etc.); basal area sometimes with irregular or longitudinal wrinkles; rarely basal area is long (in *P. toreador*) or substituted by furrow (in *P. longibasalis*). Propodeal spiracle round, separated from pleural carina by 2.0–6.0 times its own diameter.

Fore wing with second recurrent vein (2m-cu) interstitial, rarely antefurcal or slightly postfurcal; in *P. toreador* vein 2m-cu completely absent. First and second sections of radius (Rs+2r and Rs) meeting at right or slightly acute angle. Second abscissa of postnervulus present, thus brachial cell is closed posteriorly. Hind wing with nervellus (cu1&cu-a) subvertical to moderately reclivous.

Legs slender. Hind leg with tibia longer than femur and about twice as long as basitarsus. Longer hind tibial spur almost straight, with only distal end slightly curved. Tarsal claws not pectinate.

Metasoma behind tergite 1 more or less compressed laterally. First tergite slender, usually round in cross-section centrally, rarely slightly trapeziform or depressed. Glymma usually completely absent, rarely weak and isolated (i.e. not joining by furrow with ventral part of postpetiole); spiracle

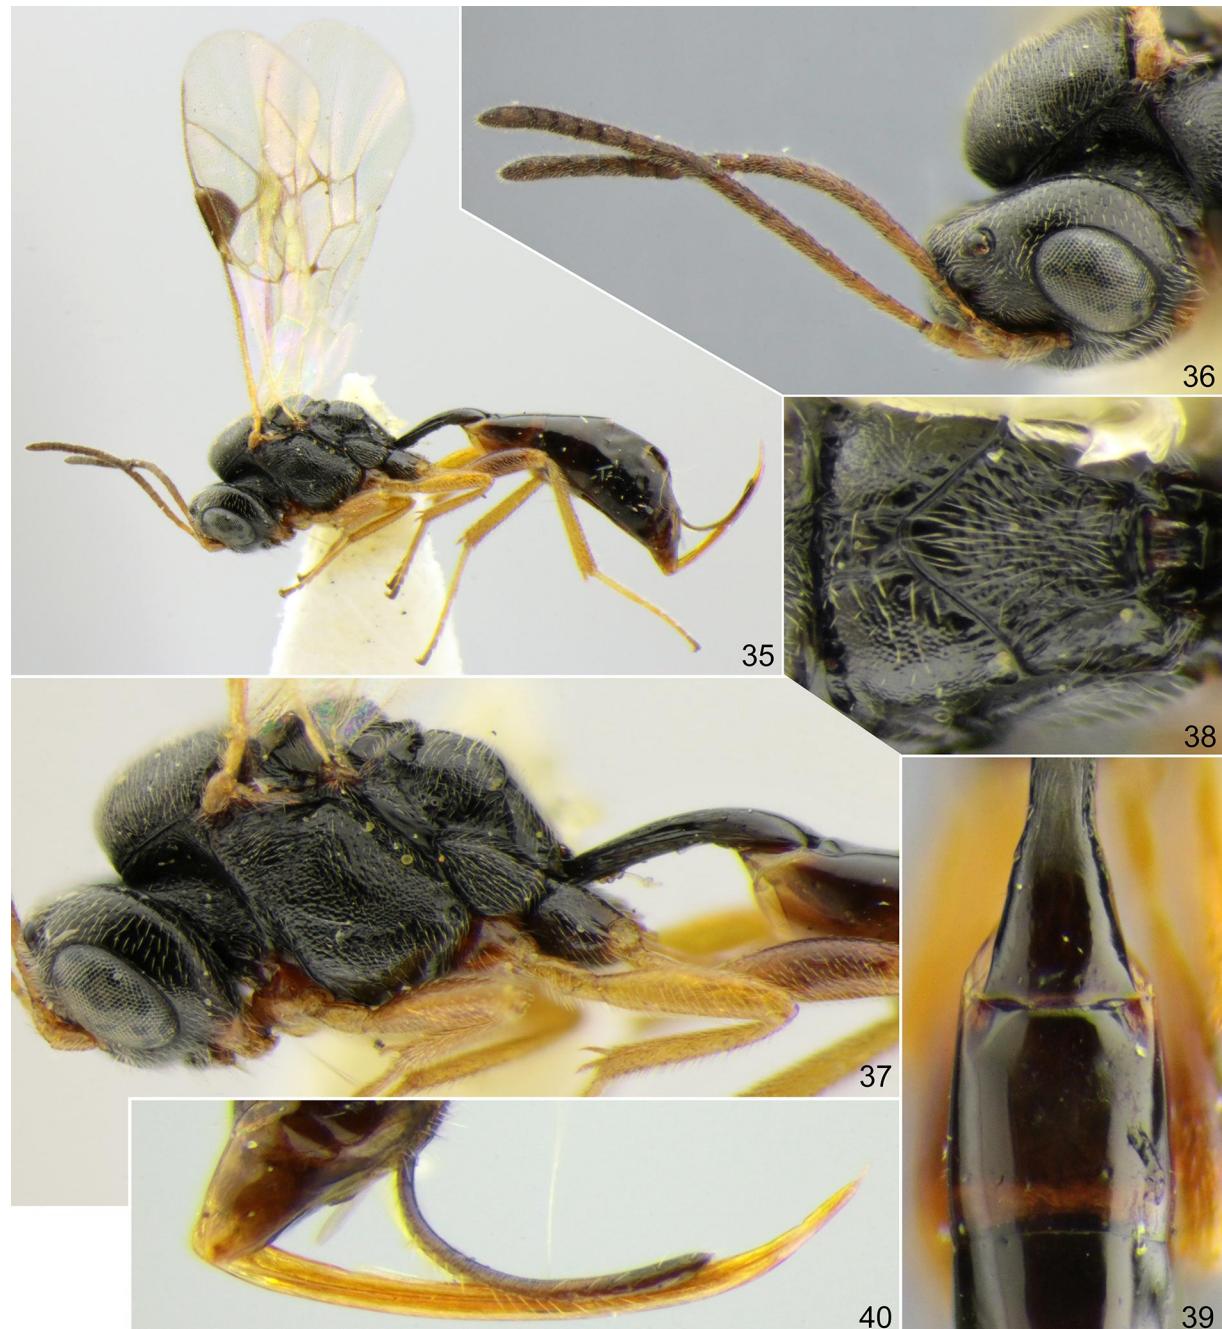

Figs 32–34. *Phradis flavipes*, holotype female: 32 — habitus, lateral view; 33 — head with antennae, lateral view; 34 — head and mesosoma, lateral view.

situated behind centre of first tergite; petiole not separated or weakly separated from postpetiole. Ovipositor slender, more or less upcurved, short to very long.

**COMPOSITION.** Moderately large genus with 63 known species worldwide: two species are known in the Afrotropical

region [Khaim, 2007], one in Australia [Khaim, 2017], one in the Neotropical region [Khaim, Bordera, 2012], 39 in the Palaearctic region [Khaim, 2015; Yu et al., 2016] and 20 in the Nearctic region [Khaim, 2002; Horstmann, 2013; Khaim, Ruiz-Cancino, 2018].
