

ORIGINAL ARTICLE

Revision of the genus *Kolibacia* Leschen and Lackner (Coleoptera: Trogossitidae: Trogossitinae)

Hiroyuki YOSHITOMI¹ and Chi-Feng LEE²¹Ehime University Museum, Ehime University, Matsuyama, Japan; and ²Taiwan Research Institute, Taichung, Taiwan**Abstract**

The genus *Kolibacia* Leschen and Lackner, 2013 is revised. Five species are recognized, one of which, *K. okinawana* sp. nov., is new to science. Two new combinations, *K. tsushima* (Nakane) and *K. regularis* (Grouvelle), are proposed and *K. regularis* is newly recorded from Vietnam.

Key words: east Palearctic, Indochina, new combination, new species, taxonomy.

INTRODUCTION

Trogossitidae is one of the lesser-studied families of the superfamily Cleroidea (Kolibáč 2010), and is represented by about 30 genera and 600 species from all zoogeographical regions. Kolibáč (2005, 2006) previously described all genera of the family, and it is expected that more taxonomic works will be published based on these revisions.

The genus *Kolibacia* (Trogossitidae: Trogossitinae: Gymnochilini) was erected for two east Palearctic taxa. The genus had been recognized as a member of the genera *Leperina* or *Lepidopteryx* (Leschen & Lackner 2013). All the taxa are distributed in East Asia (mainly Japan), but its taxonomic status has not been revised (Kolibáč 2009; Leschen & Lackner 2013). In addition, the Taiwanese species of this genus have been neglected (Kolibáč 2009; Leschen & Lackner 2013).

In the present paper, we review the species of the genus *Kolibacia*.

MATERIALS AND METHODS**Materials**

The present study is based on the specimens deposited in the following institutes and private collections: the Natural History Museum, London (BMNH); the Senckenberg Deutsches Entomologisches Institut (DEI); Ehime University Museum, Matsuyama (EUMJ);

Kurashiki Museum of Natural History, Kurashiki (KURA); Korea University, Tokyo (KUT); the National Science Museum, Tsukuba (NSMT); the Taiwan Agricultural Research Institute, Taichung (TARI); Kenji Otsuka private collection (KOC); Hiroshi Otobe private collection (HOC); and Katsumi Akita private collection (KAC). The type specimens designated in this paper are deposited in the EUMJ, NSMT, KOC, HOC or KAC.

Methods

General observation and dissection were made under a stereoscopic microscope. Dissected parts were mounted on hollow slides with pure glycerin and observed under a microscope. After observation, the dissected parts were mounted on the same card as the specimens.

Terminology

The terminology refers generally to Kolibáč (2005, 2006), Kolibáč and Leschen (2010) and Leschen and Lackner (2013).

Abbreviations for measurements

PL, length of pronotum in median line; PW, maximum width of pronotum; EL, length of elytra in suture from anterior margin of scutellum to elytral apex; EW, maximum width of elytra; TL, total length (PL + EL). The average is given in parentheses after the range.

TAXONOMY**Genus *Kolibacia* Leschen & Lackner, 2013**

Received 21 June 2013; accepted 18 July 2013.

Kolibacia Leschen & Lackner, 2013, 288 (Type species: *Leperina tibialis* Reitter 1889, by the original designation).

Diagnosis. Body length (TL) 7–17 mm. Coloration of body black or reddish brown. Dorsal surface of head, pronotum, scutellum and elytra sparsely covered with scales forming rather irregular patterns. Front margin of labrum straight or shallowly concave. Antennae 11 segmented, with loose club. Elytra oblong, subparallel-sided near base to apical 1/4, with 6–8 elytral carinae; intercarinal space bipunctate.

Sexual dimorphism. Frons strongly depressed in male, weakly in female. Tuft of setae on submentum (ctenidium) present in male (Figs 13,15–20), absent in female (Fig. 14). Lateral margin of pronotum slightly curved in male, arcuate in female.

Remarks. Based on the result of phylogenetic analysis, Leschen and Lackner (2013) erected the new genus *Kolibacia* for the Asian taxa, which have been described under the Australasian genus *Leperina* Erichson, 1844 (type species: *Trogosita decorata* Erichson, 1844).

The tribe Gymnochilini (sensu Kolibáč 2006; Leschen & Lackner 2013) includes nine genera from South America (Chile), Asia, Australasia, and Europe to Africa (Leschen & Lackner 2013). Of these, four genera (“split-eyed group” in Leschen & Lackner 2013: *Anacypta* Illiger, *Narcisa* Pascoe, *Xenoglena* Reitter and *Gymnocheilis* Dejean) have a divided eye with a small ventral portion located below the head and connected to the larger main eye by a row of elongate ommatidia (Leschen & Lackner 2013), and are easily distinguished from the other genera including *Kolibacia* in having a non-divided eye. The genus *Kolibacia* is also distinguished from the remaining genera by the presence of scaly setae (*Melambia* Erichson (distributed in Africa) and *Seidlitzella* Jakobson (Europe) are not covered with scales on the dorsal surface), continuous elytral carinae (*Phanodesta* Reitter (Juan Fernandez Islands, Chile and Australasia) having beaded elytral carinae), and a bipunctate intercarinal space in the elytra (*Leperina* Erichson (Australasia) multipunctate).

Key to species of the genus *Kolibacia*

1. Body smaller, TL 7.1–13.1 mm; tegmen short, with short phallobasic apodeme and tegminal struts (Figs 38–40,43–45); parameres long, as long as phallobasic apodeme; phallus short and stout (Figs 41,42,46,47) 2
- Body larger, TL 7.3–16.8 mm; tegmen long, with long phallobasic apodeme and tegminal struts (Figs 48–50,57–59,62–64); parameres shorter than phallobasic apodeme; phallus long and slender (Figs 51,52,60,61,65,66) 3
2. Scales on mesal portion of elytra mostly oblong (Fig. 12, L/W = about 3.0); posterior margin of male sternite VIII straight (Fig. 33); apical portions of tegmen and phallus relatively short (Figs 38–42); distributed in Japan (Hokkaido, Honshu), North and South Korea, northeast China, Mongolia, Russian Far East, East Siberia *K. squamulata*
- Scales on mesal portion of elytra mostly oval (Fig. 12, L/W = about 1.5); posterior margin of male sternite VIII arcuate (Fig. 34); apical portions of tegmen and phallus relatively long (Figs 43–47); distributed in Tsushima, Japan *K. tsushima*
3. Tibiae clearly covered with white scaly setae in apical parts (Fig. 54); abdominal ventrites dark reddish brown (Fig. 56); distributed in Hokkaido to Kyushu *K. tibialis*
- Tibiae lacking scaly setae (Fig. 53); abdominal ventrites black (Fig. 55) 4
4. Scale-like setae on dorsal surface of body wide and distinct (Fig. 12); phallobasic apodeme expanded laterally in caudal part, then tapered anteriorly (Fig. 62); distributed in Taiwan and Vietnam *K. regularis*
- Scale-like setae on dorsal surface of body thin and indistinct (Fig. 12); phallobasic apodeme evenly tapered anteriorly (Fig. 57); distributed in Amami-Ōshima and Okinawa-jima ... *K. okinawana* sp. nov.

Kolibacia squamulata (Gebler, 1830)

(Figs 1,7,12,15,21,27,33,38–42,53,55)

urn:lsid:zoobank.org:act:8384B69A-ECC9-490D-AD16-66A7E0C7402F

[Japanese name: Gomadara-kokunusuto]

Peltis squamulata Gebler, 1830, 97.

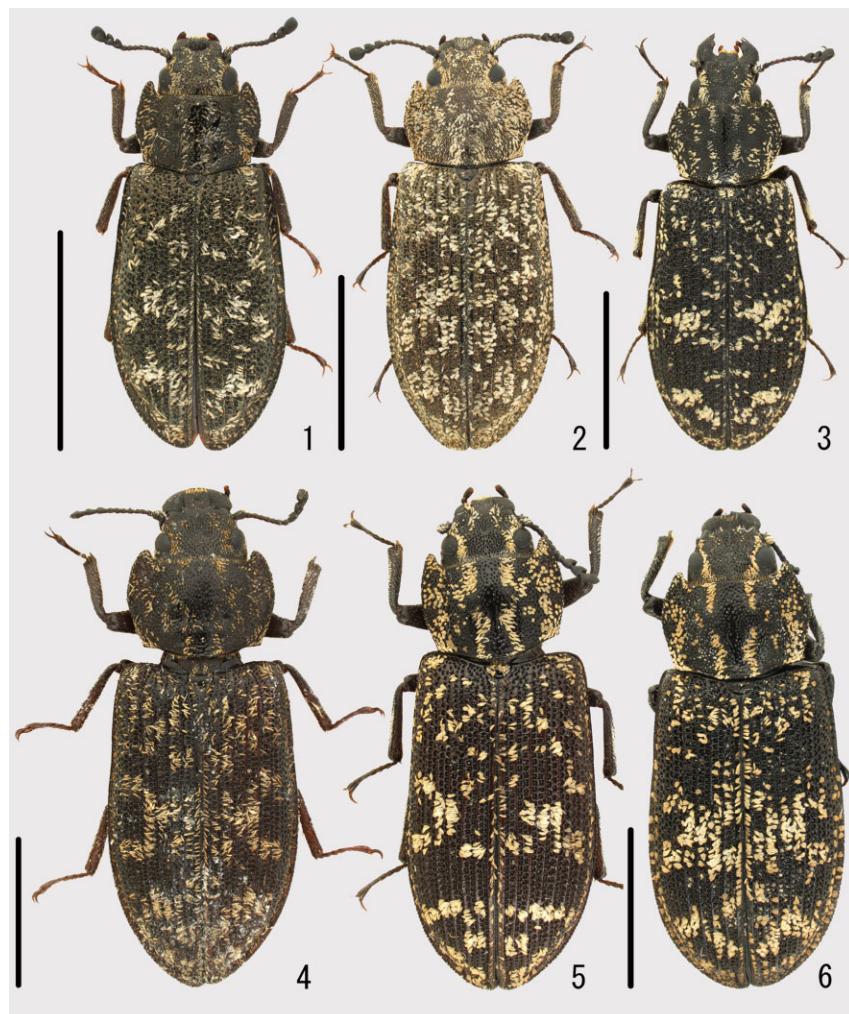

Leperina squamulosa (misspelling): Miyatake, 1985, 148, pl. 24, no. 3; Chûjô & Lee, 1994, 187; Zaitsev, 2008 [photo of larva].

Leperina squamulata: Kolibáč, 2007, 364.

Kolibacia squamulata squamulata: Leschen & Lackner, 2013, 288.

Specimens examined. Hokkaido. 1 male (EUMJ), “Hokkaido Asahi-mura Jul. 26. 1952 T. Hasegawa”; 2 females (EUMJ; 1 female figured in Miyatake 1985, 148, pl. 24, no. 3), same data but “Jun. 28. 1952”; 1 female (EUMJ), same data but “Jun. 29. 1952”; 1 female (EUMJ), “Maruyama Sapporo VI. 24. 1941 Y. Nishio”.

Honshu. 2 females (EUMJ), “Mt. KANNABE HYÔGO 26. VII. 1981 K. ANDO”; 1 male and 2 females (EUMJ), “Kisofukushima Kiso-gun Nagano Pref. 6, VII, 1991 H. Yoshitomi leg.”; 1 male (EUMJ), same data but “20. VI. 1993”; 1 male (EUMJ), “Hirugano, Gifu VII-16. 1949 K. Ohbayashi”; 1 male,

Figures 1–6 Adults of *Kolibacia* spp.
1 *K. squamulata*; 2 *K. tsushima*;
3 *K. tibialis*; 4 *K. okinawana* sp.
nov., holotype; 5 *K. regularis* from
Taiwan; 6 Ditto from Vietnam. Scale
bars: 5.0 mm.

Russia. 1 female, “Mt. Sestra Primorskii Russia 17-VIII-1992 M. Sato leg.”.

China. 2 females (EUMJ), “[Manchuria] Mutanchiang – Chientao orientalis 24. vi. 1994 Takeo Gotô”.

Korea. 1 female (KUT), “DPR. KOREA Pyong Yang City Mt. Daesong-san 25. VI. 2009 Changdo Han leg.”, “TOKYO [JAPAN] Collection of Wildlife Research Center In Korea University”.

Redescription. Male. Coloration of body black, strongly shiny; maxillary and labial palpi, tibiae and tarsi brownish. Scales (Fig. 12) on head, pronotum, scutellum and elytra white, oblong ($L/W = 2.5–4.5$), sparsely and irregularly distributed.

Head (Fig. 21) coarsely and densely punctate, depressed dorsally in frons. Front margin of clypeus shallowly concave. Tuft of setae on submentum (Fig. 15) golden, short, bearing narrowly. Antennae relatively short, reaching about anterior 1/3 of pronotum. Pronotum (Fig. 27) widest at middle, coarsely and densely punctate in lateral portion, coarsely and sparsely

Figures 7–11 Left antennae of *Kolibacia* spp. in dorsal view. 7 *K. squamulata*; 8 *K. tsushima*; 9 *K. tibialis*; 10 *K. okinawana* sp. nov., paratype; 11 *K. regularis*. Scale bars: 1.0 mm.

“Agematsu Nagano Pref. 10. VIII. 1983 K. Fukuzumi”; 1 male and 1 female, same locality, but “21. VIII. 1993 H. Yoshitomi leg.”; 1 female (EUMJ), “IDANI, GIFU 23, VI. 1957 N. Ohbayashi”.

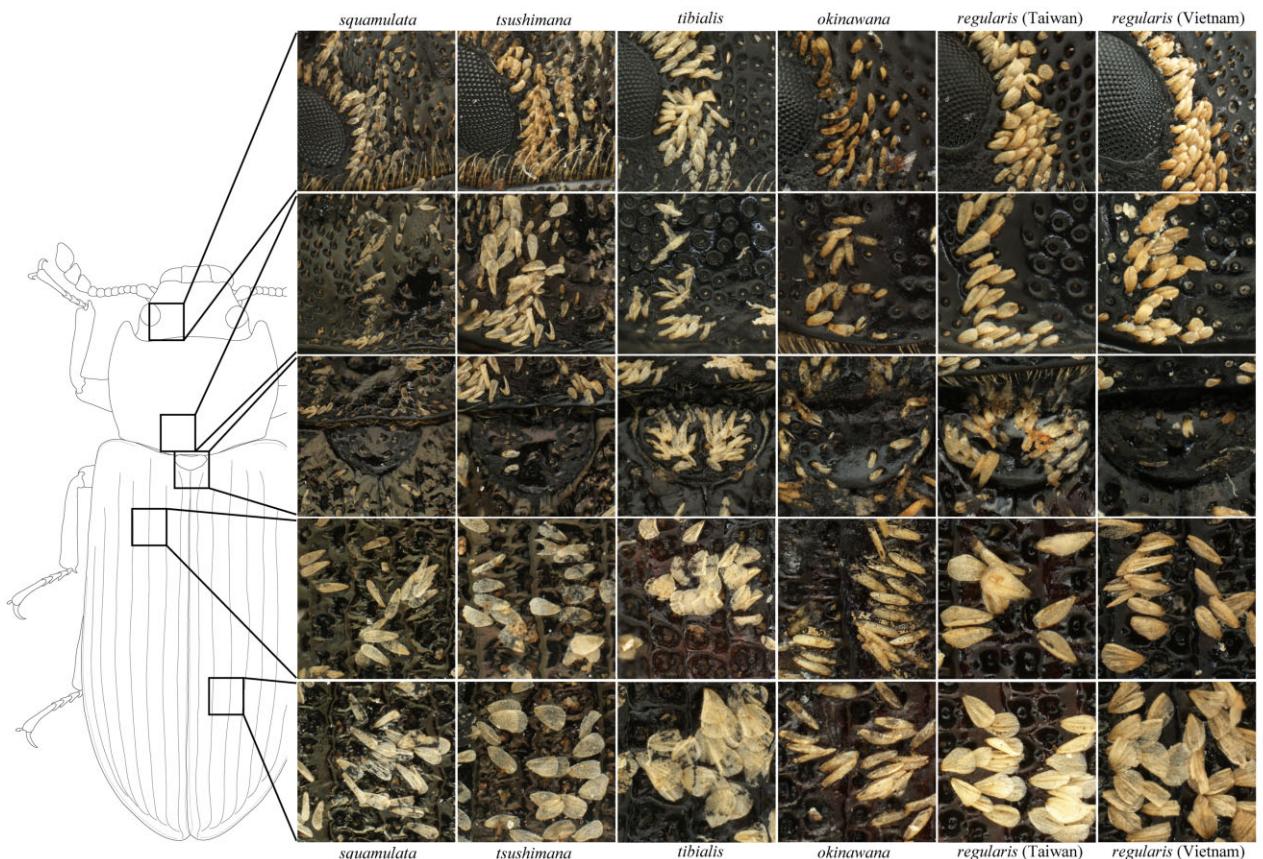

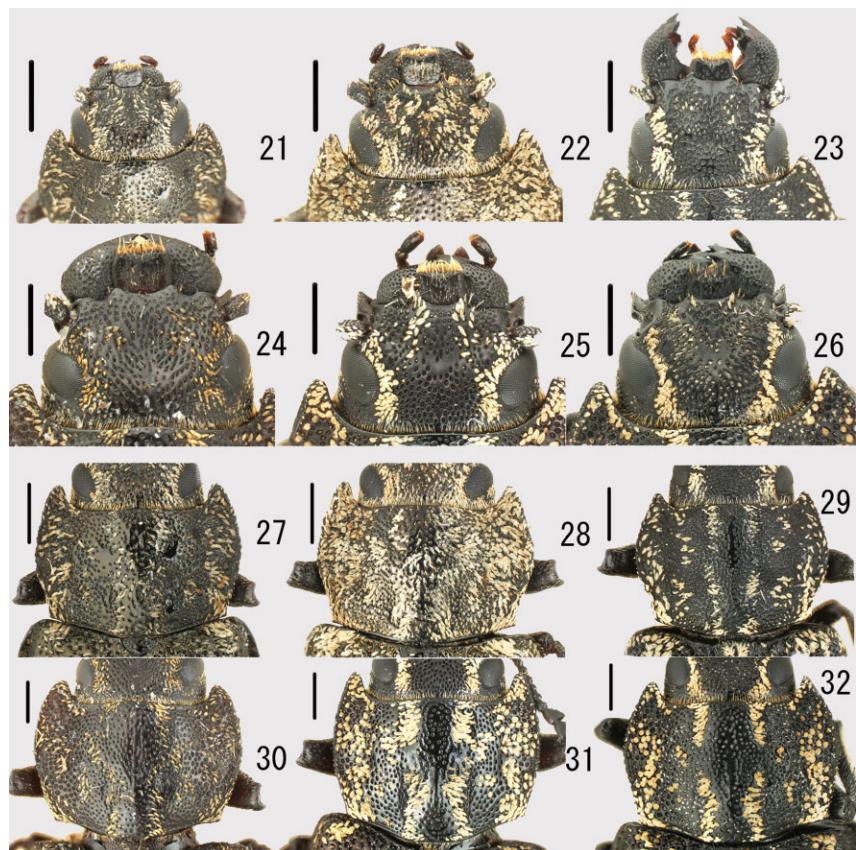

Figure 12 Scale-like setae on dorsal surface of *Kolibacia* spp. Scale = 1.0 mm.

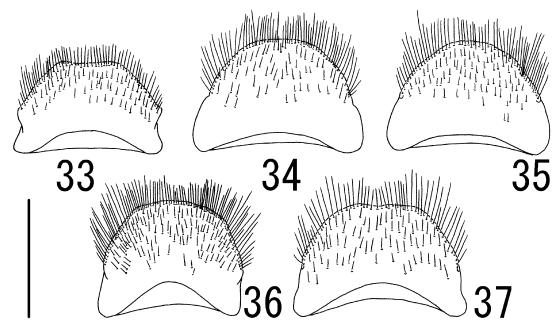

Figures 13–20 Head of *Kolibacia* spp. in ventral view (male: 13,15–20; female: 14). 13,14 *K. okinawana* sp. nov., paratypes; 15 *K. squamulata*; 16 *K. tsushima*; 17–19 *K. tibialis*; 20 *K. regularis*. Scale bar: 1.0 mm.

punctate in mesal portion, with two pairs of shallow and small submesal concavities in apical 1/3 and 2/3 of disk; anterior corners rather pointed; PW/PL 1.53–1.71 (1.64). Scutellum subtriangular; W/L about 1.4. Elytra with indistinct six pairs of carinae, rather raised in basal portion of 2nd and 4th carinae; epipleuron relatively wide, gently tapering posteriorly; EL/EW 1.44–1.62

(1.56); EL/PL 3.34–3.67 (3.52); EW/PW 1.33–1.42 (1.38); TL/EW 1.88–2.08 (2.00). Prosternum sparsely covered with short setae, with narrow longitudinal glabrous area in mesal portion; hypomeron rugose, bearing short setae; posterior margin of prosternal process straight. Mesoventrite closely punctate, with longitudinal glabrous area.

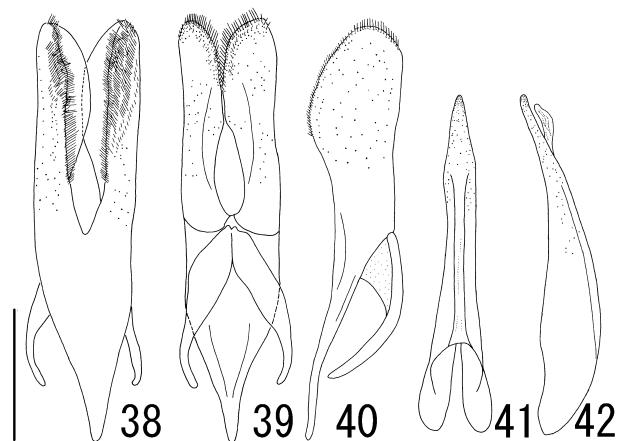

Figures 21–32 Head (21–26) and pronotum (27–32) of *Kolibacia* spp. in dorsal view. 21,27 *K. squamulata*; 22,28 *K. tsushima*na; 23,29 *K. tibialis*; 24,30 *K. okinawana* sp. nov., paratype; 25,31 *K. regularis* from Taiwan; 26,32 Ditto from Vietnam. Scale bars: 1.0 mm.

Figures 33–37 Male sternite VIII of *Kolibacia* spp. 33 *K. squamulata*; 34 *K. tsushima*na; 35 *K. tibialis*; 36 *K. okinawana* sp. nov., paratype; 37 *K. regularis*. Scale bar: 1.0 mm.

Sternite VIII trapezoidal, straight in caudal margin, bearing short setae in caudal margin.

Tegmen short and stout; phallobasic apodeme short, evenly tapered anteriorly; tegminal struts reaching about basal 1/8 of tegmen; parameres long and wide, about 0.50 times as long as length of tegmen, densely covered with long spines and fine punctures in dorsal aspect. Phallus short, about 0.8 times as long as tegmen, slightly curved dorsally in apical portion, thick in basal portion, punctate in apical portion.

Figures 38–42 Male genitalia of *Kolibacia squamulata*. 38 Tegmen, dorsal view; 39 Ditto, ventral view; 40 Ditto, lateral view; 41 Phallus, dorsal view; 42 Ditto, lateral view. Scale bar: 0.5 mm.

Female. PW/PL 1.56–1.73 (1.64); EL/EW 1.61–1.73 (1.67); EL/PL 3.58–3.79 (3.68); EW/PW 1.28–1.41 (1.35); TL/EW 2.05–2.21 (2.12).

Measurements. Male ($n = 6$): TL 7.87–10.35 (8.74) mm; PW 2.75–3.93 (3.17) mm; PL 1.70–2.30 (1.94)

mm; EL 6.15–8.05 (6.80) mm; EW 3.80–5.22 (4.37) mm. Female ($n = 13$): TL 7.10–12.00 (9.92) mm; PW 2.60–4.15 (3.47) mm; PL 1.50–2.60 (2.12) mm; EL 5.60–9.40 (7.80) mm; EW 3.47–5.70 (4.67) mm.

Distribution. Japan (Hokkaido, Honshu); North and South Korea, northeast China, Mongolia, Russian Far East, East Siberia.

Biological notes. In Japan, this species is mainly distributed in the northeastern area (Hokkaido to Shinshu District) except for Mt. Kannabe (469 m a.s.l.), which is in Hyōgo Pref., Kinki District (Fig. 67). The species is easily collected from a mountainous lumberyard, and mainly attack conifer woods.

***Kolibacia tsushimaana* (Nakane, 1985),
comb. nov. (Figs 2,8,12,16,22,28,34,43–47)**

Lepidopteryx squamulosa tsushimaana Nakane, 1985, 162.

Leperina tsushimaana: Miyatake, 1985, 148, pl. 24, no. 4. *Lepidopteryx squamulata tsushimaana*: Kolibáč, 2009, 128. **Specimens examined.** 4 Males and 5 females (EUMJ), “Uchiyama Tsushima isl. 21. VI. 1991 N. Okimoto leg.”; 1 male and 1 female (EUMJ), “Nagasaki: Japan Mt. Mitake Kamiagata-chô 13. VI. 2002 T. Kurihara leg.”; 1 male (EUMJ), “Mt. ŌBOSHI TSUSHIMA Is. 8. VII. 1984 M. HIRANO”; 1 male (EUMJ), “(TSUSHIMA) Mt. Mitake 29. VI. 1980 leg. N. Ohbayashi”; 1 female (EUMJ, figured in Miyatake 1985, 148, pl. 24, no. 4), “(TSUSHIMA) Sago Kamiagata-cho May 16, 1978 S. Hisamatsu”, “8-04”; 1 male and 1 female

(EUMJ), “(TSUSHIMA I.) Meboro 7. V. 1978 A. Oda leg.”; 1 male (EUMJ), “Kechi TSUSHIMA Is. 19. VI. 1974 Y. KITSUKI”; 2 males and 4 females (EUMJ), “SASUNA TSUSHIMA Is. 14. vii. 1984 K. ANDO”.

Redescription. Male. Color of body black, strongly shiny; tibiae and tarsi rather brownish. Scales (Fig. 12) on head, pronotum and scutellum white, oblong ($L/W = 2.5–4.5$); scales on elytra cream to white, oblong to oval ($L/W = 1.2–4.0$).

Head (Fig. 22) coarsely and closely punctate, depressed dorsally in frons; front margin of clypeus shallowly concave. Tuft of setae on submentum (Fig. 16) brown, short, widely bearing. Antennae relatively short, reaching about anterior 1/3 of pronotum. Pronotum (Fig. 28) widest at middle, coarsely and closely punctate in lateral portion, coarsely and sparsely punctate in mesal portion, with two pairs of shallow submesal concavities in anterior 1/3 and 2/3 of disc; anterior corners rather pointed; PW/PL 1.51–1.73 (1.63). Prosternum sparsely covered with short setae, with wide glabrous area in mesal portion; hypomeron rugose, bearing short setae; posterior margin of prosternal process straight. Mesoventrite closely punctate, with longitudinal glabrous area. Scutellum subtriangular; W/L about 1.7. Elytra with indistinct 6 elytral carinae, rather raised in 2nd and 4th carinae; epipleuron relatively wide, gently tapering posteriorly; EL/EW 1.58–1.71 (1.63); EL/PL 3.25–3.71 (3.45); EW/PW 1.23–1.37 (1.30); TL/EW 2.02–2.20 (2.10).

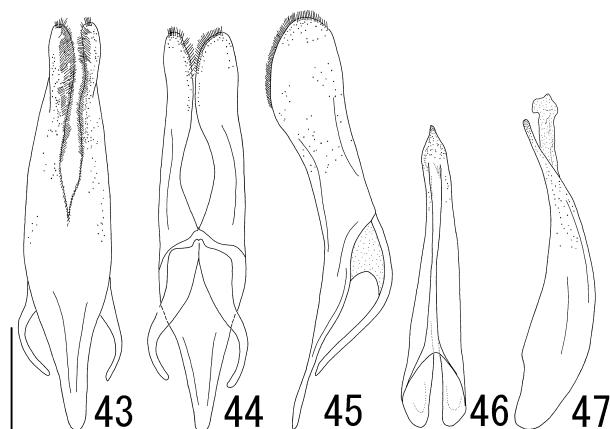

Sternite VIII semicircular, bearing short setae in caudal margin. Tegmen short and stout; phallobasic apodeme relatively short, gently tapered anteriorly; tegminal struts short, strongly curved interiorly, reaching about basal 1/8 of tegmen; parameres long and wide, about 0.53 times as long as length of tegmen, slightly curved dorsally, densely covered with long spines and fine punctures in dorsal aspect. Phallus short, about 0.8 times as long as tegmen, curved dorsally in apical portion, thick in basal portion, elongate and punctate in apical portion.

Female. PW/PL 1.10–1.74 (1.60); EL/EW 1.57–1.80 (1.65); EL/PL 2.54–4.02 (3.57); EW/PW 1.26–1.46 (1.36); TL/EW 2.00–2.42 (2.11).

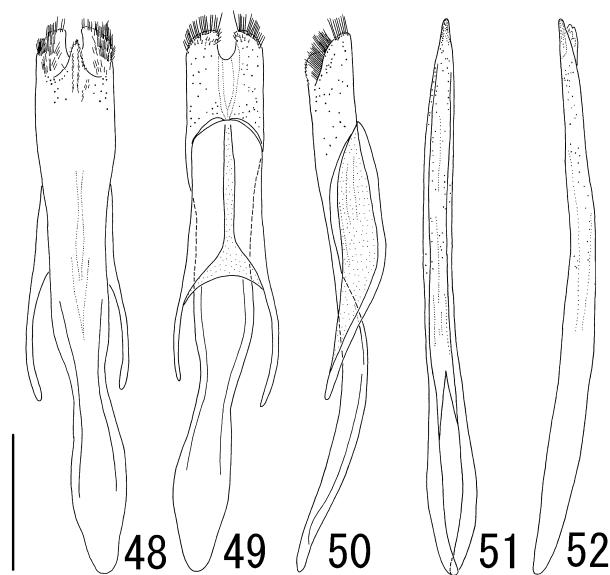

Measurements. Male ($n = 10$): TL 8.00–12.08 (10.35) mm; PW 2.90–4.50 (3.80) mm; PL 1.70–2.70 (2.33) mm; EL 6.30–9.38 (8.03) mm; EW 3.90–5.55 (4.93) mm. Female ($n = 11$): TL 8.35–13.05 (10.87) mm; PW 2.80–4.35 (3.78) mm; PL 1.80–3.35 (2.40) mm; EL 6.55–10.45 (8.47) mm; EW 4.10–5.95 (5.14) mm.

Distribution. Japan (Tsushima).

Biological notes. The species is common in Tsushima Island from lowland to mountainous areas, and attacks broadleaf woods in a lumberyard.

Figures 43–47 Male genitalia of *Kolibacia tsushimaana*. 43 Tegmen, dorsal view; 44 Ditto, ventral view; 45 Ditto, lateral view; 46 Phallus, dorsal view; 47 Ditto, lateral view. Scale bar: 0.5 mm.

VII. 1994 N. Ohbayashi leg.”; 1 female, “[Ehime JAPAN] Koyayama Odamiyama 5. VI. 1997 E. Yamamoto”.

Kyushu. 1 male (EUMJ), “Kurodake Ohita Pref. 8. VII. 1995 K. Sasagawa”.

Redescription. Male. Color of body black, strongly shiny; abdominal ventrites III~VII reddish brown (Fig. 56). Scales (Fig. 12) on head, pronotum and scutellum cream, oblong ($L/W = 3.0\text{--}4.0$); scales on elytra white to cream, oval ($L/W = 1.0\text{--}2.0$).

Head (Fig. 23) coarsely and closely punctate, slightly depressed dorsally in frons; front margin of clypeus shallowly concave. Tuft of setae on submentum (Figs 17~19) golden, long, bearing narrowly in smaller specimens and widely in larger specimens. Pronotum (Fig. 29) widest at middle, coarsely and closely punctate throughout, but punctures on mesal part rather small; longitudinal narrow glabrous line present on midline of anterior half; anterior corners obtuse; PW/PL 1.42~1.63 (1.53). Prosternum sparsely covered with short setae, with narrow or absent glabrous area in mesal portion; hypomeron rugose, bearing short setae; posterior margin of prosternal process straight. Mesoventrite closely and coarsely punctate, lack glabrous area. Scutellum semicircular; W/L about 2.0. Elytra with indistinct 8 elytral carinae; epipleuron relatively narrow, abruptly tapering posteriorly; EL/EW 1.63~1.85 (1.72); EL/PL 3.44~3.74 (3.55); EW/PW 1.27~1.42 (1.35); TL/EW 2.09~2.35 (2.20). Tuft of scaly setae on dorsal surface of tibiae (Fig. 54) white, situated on proximal 1/3 to near apex.

Sternite VIII semicircular, bearing long setae in caudal part. Tegmen long and slender; phallobasic apodeme long and stout, widened in basal portion; tegminal struts long, reaching about basal 1/3 of tegmen; parameres short, fused in basal portion, about 0.18 times as long as length of tegmen, densely covered with short spines in dorsal part. Phallus long and slender, a little longer than tegmen, weakly curved dorsally, punctate in apical part.

Female. PW/PL 1.39~1.60 (1.49); EL/EW 1.63~1.84 (1.74); EL/PL 3.39~4.04 (3.74); EW/PW 1.36~1.57 (1.45); TL/EW 2.04~2.30 (2.20).

Measurements. Male ($n = 19$): TL 7.25~12.6 (10.10) mm; PW 2.40~4.40 (3.40) mm; PL 1.60~2.75 (2.22) mm; EL 5.65~9.85 (7.88) mm; EW 3.30~5.60 (4.60) mm. Female ($n = 17$): TL 8.88~14.35 (10.90) mm; PW 2.88~4.60 (3.42) mm; PL 1.98~3.00 (2.30) mm; EL 6.90~11.35 (8.61) mm; EW 3.97~6.80 (4.96) mm.

Distribution. Japan (Hokkaidō, Honshū, Shikoku, Kyūshū).

Biological notes. This species is endemic to Japan, and is distributed in northern to southern areas (Fig. 67). The species is readily collected from a mountainous lumberyard, and attacks broadleaf and conifer woods.

Remarks. Judging from the original description, this species had been described based on some specimens, but we could examine only one syntype deposited in BMNH.

Kolibacia okinawana sp. nov.

Description. Male. Color of body black, strongly shiny. Scales (Fig. 12) on head, pronotum, scutellum and elytra cream, oblong ($L/W = 2.0-4.5$).

Head (Fig. 24) coarsely and closely punctate, slightly depressed dorsally in frons; front margin of clypeus shallowly concave. Tuft of setae on submentum (Fig. 13) brown, short, widely bearing. Pronotum (Fig. 30) widest at middle, coarsely and closely punctate in lateral portion, coarsely and sparsely punctate in mesal portion, with two pairs of shallow submesal concavities in apical 1/3 and 2/3 of disc, but anterior ones indistinct; anterior corners rounded; PW/PL 1.52–1.59 (1.56). Prosternum sparsely covered with minute setae, with narrow longitudinal glabrous area in mesal portion; hypomeron rugose, bearing short setae; posterior margin of prosternal process gently curved. Mesoventrite closely punctate, with longitudinal glabrous area. Scutellum semicircular; W/L about 1.7. Elytra with 6 elytral carinae; epipleuron relatively wide, gently tapering posteriorly; EL/EW 1.58–1.72 (1.64); EL/PL 3.21–3.38 (3.31); EW/PW 1.27–1.38 (1.30); TL/EW 2.04–2.23 (2.14).

Sternte VIII semicircular, closely bearing long setae in caudal part. Tegmen long and slender; phallobasic apodeme long, evenly tapered anteriorly; tegminal struts long, reaching about basal 2/9 of tegmen; parameres short, about 0.17 times as long as length of tegmen, densely covered with short spines in dorsal part. Phallus long, as long as tegmen, gently curved dorsally, distinctly tapered in basal part, sparsely punctate in apical part.

Female. PW/PL 1.51–1.64 (1.56); EL/EW 1.61–1.78 (1.70); EL/PL 3.23–3.64 (3.49); EW/PW 1.24–1.37 (1.32); TL/EW 2.08–2.29 (2.19).

Measurements. Male ($n = 6$): TL 11.05–14.90 (13.10) mm; PW 3.90–5.30 (4.73) mm; PL 2.55–3.40 (3.04) mm; EL 8.50–11.50 (10.06) mm; EW 4.95–7.30 (6.14) mm. Female ($n = 16$): TL 11.40–16.80 (13.73) mm; PW 3.83–6.00 (4.77) mm; PL 2.50–3.90 (3.06) mm; EL 8.90–12.90 (10.67) mm; EW 5.10–7.85 (6.29) mm.

Distribution. Japan (Amami-Ôshima, Okinawa-jima).

Biological notes. The species is collected from broadleaf woods in lowland to mountainous areas.

Kolibacia regularis (Grouvelle, 1913), comb.

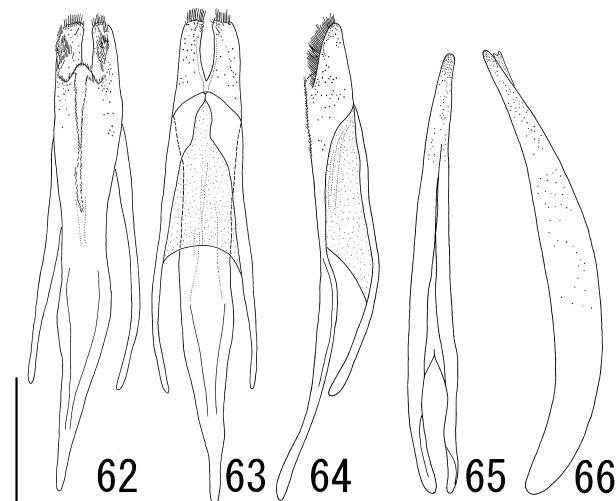

nov. (Figs 5,6,11,12,20,25,26,31,32,37,62–66)

Ohbayashi leg.”; 1 female (EUMJ), “[FORMOSA] Taidainojo nr. Jenai Nan Tow Country IV-17, 1976 K. Ushijima leg.”.

Vietnam. 1 Male (KURA), “Tam Dao Vinh Phu Prov. N. Vietnam Apr. -7 May 1996 Native leg.”, “Kurashiki Mus. N. H. Exot. Insect Coll. no. 28300”; 1 male and 1 female (HOC), “Tam Dao V N. Vietnam May, 1998 K. Aramaki”.

Redescription. Male. Color of body black, strongly shiny. Scales (Fig. 12) on head, pronotum and scutellum cream, oblong ($L/W = 2.0\text{--}3.0$); scales on elytra cream, oval ($L/W = 1.0\text{--}2.0$).

Head (Figs 25,26) coarsely and closely punctate, slightly depressed dorsally in frons; front margin of clypeus shallowly concave. Tuft of setae on submentum (Fig. 20) brown, short, narrowly bearing. Pronotum

(Figs 31,32) widest at middle, coarsely and closely punctate in lateral portion, coarsely and sparsely punctate in mesal portion; midline narrowly and indistinctly glabrous; two pairs of shallow and oblong submesal concavities present in near anterior margin and posterior 1/3 of disk; anterior corners rounded; PW/PL 1.43–1.54 (1.48). Prosternum sparsely covered with minute setae, with narrow longitudinal glabrous area in mesal portion; hypomeron rugose, bearing short setae; posterior margin of prosternal process straight. Mesoventrite closely punctate, with longitudinal glabrous area. Scutellum semicircular; W/L about 2.4. Elytra rather distinct in 6 elytral carinae; epipleuron relatively narrow, abruptly tapering posteriorly; EL/EW 1.50–1.74 (1.66); EL/PL 3.16–3.42 (3.31); EW/PW 1.29–1.37 (1.35); TL/EW 1.98–2.26 (2.16).

Sternite VIII semicircular, shallowly concave in caudal margin, bearing long setae in caudal part. Tegmen long and slender; phallobasic apodeme long, abruptly tapered anteriorly in basal 1/3; tegminal struts long, reaching about basal 1/4 of tegmen; parameres short, about 0.15 times as long as length of tegmen, densely covered with short spines in dorsal part. Phallus long, a little shorter than tegmen, gently curved dorsally, evenly tapered basally and apically, sparsely punctate in apical part.

Female. PW/PL 1.41–1.52 (1.45); EL/EW 1.56–1.81 (1.66); EL/PL 3.13–3.65 (3.32); EW/PW 1.33–1.44 (1.39); TL/EW 2.03–2.31 (2.15).

Measurements. Male ($n = 7$): TL 11.70–15.80 (14.01) mm; PW 3.93–5.85 (4.82) mm; PL 2.65–3.80 (3.26) mm; EL 9.05–12.00 (10.75) mm; EW 5.40–8.00 (6.49) mm. Female ($n = 10$): TL 11.30–16.15 (14.19) mm; PW 3.80–5.40 (4.75) mm; PL 2.70–3.70

(3.28) mm; EL 8.60–12.45 (10.91) mm; EW 5.30–7.40 (6.58) mm.

Distribution. Taiwan, Vietnam (new record).

Biological notes. This species is common in Taiwan from lowland to mountainous areas.

Remarks. Judging from the original description, this species had been described based on many specimens (“Nombreux exemplaires” in Grouvelle 1913), but we could examine only two syntypes deposited in BMNH and DEI.

DISCUSSION

As a result of our revision, five species of the genus *Kolibacia* are recognized from the eastern part of Asia including a part of the Oriental Region. *Kolibacia squamulata* is widely distributed between Mongolia to the northeastern part of Japan, and its sibling species *K. tsushima*, which has been treated as a subspecies of *K. squamulata* but is treated as an independent species in this paper, is limited to Tsushima Island. *Kolibacia tibialis* is distributed in Japan from Hokkaido to Kyushu, and is sympatric to *K. squamulata* in Hokkaido and the northern part of Honshu. However, the former species generally inhabits a lower altitude area than the latter. *Kolibacia okinawana* is distributed in Okinawa-jima and Amami-Oshima, and the related species *K. regularis* is distributed in Taiwan and Vietnam.

ACKNOWLEDGMENTS

We thank Dr Y Okushima (KURA), Dr C Han (KUT), K Akita, H Otobe, K Otsuka, Y Hirano, H Ogane and N. Okimoto for the opportunity to examine the specimens. We also thank Drs JF Lawrence, R Leschen, J Kolibáč and M Miyatake for information on taxonomy; T Ueno and H Murakami for helpful advice on literature; and D Murphy (The United Graduate School of Agricultural Sciences, Ehime University) for his critical reading of the manuscript. This study is supported in part by the KAKENHI (24405028; head investigator: S. Okajima).
