

# A Catalog and Bibliography of Longhorned Beetles from Borneo (Coleoptera: Cerambycidae, Disteniidae and Vesperidae)

Electronic Version, 2013.1

by

Daniel J. Heffern

## Abstract

A catalog and bibliography are presented for the longhorned beetles of Borneo. All genus-group names (including subgenera and synonyms) and species-group names (including synonyms) of taxa known from Borneo are summarized. The type species for each genus-group name is specified with the method by which its type species was designated. Species-group names include the name of the genus used in the original description. The full distribution of each species or subspecies which occurs in Borneo is included. Citations of original descriptions and bibliographies are provided for all taxa. Species which have been incorrectly recorded from Borneo are listed.

## Introduction

In recent years, taxonomists have separated longhorned beetles into three families: the Cerambycidae, Disteniidae and Vesperidae. These beetles are popular with collectors, entomologists, and naturalists, for many reasons including their striking appearance, diversity, relationship with host plants and interaction with other species, including mimetic behavior. Borneo, which has not been heavily collected, still contains many species that are undescribed or difficult to identify. In the past 20 years, Mr. Steven Bosuang has provided many specimens of all Coleoptera to the scientific community which has resulted in dozens of publications concerning the fauna of Northern Borneo. The purpose of this catalog is to present a consolidated list of all known longhorned beetles from Borneo. Some unpublished records are included, mostly from the collection of the author, which have been identified by the author or other specialists. An effort has been made to provide proper spellings, combinations, and literature references for the purposes of nomenclatural stability and basic information to assist anyone who wishes to do further research.

For convenience in this catalog:

- Families, subfamilies and tribes are in boldface type and listed in an assumed phylogenetic sequence similar to some older catalogues, rather than just alphabetically
- Valid genus-group names are in boldface type and listed alphabetically under tribes
- Valid species-group names are in boldface type and listed alphabetically under genera
- Synonyms and mis-spellings are italicized and listed from oldest to newest
- Type species are listed in italics for genus-group names and the method of how the type species was designated is noted

The general format used in this catalog is as follows:

**[Genus]** [Author], [year]:[page # of description] (type species: *Genus species* Author, year, designation method)

[*Synonym*] [Author], [year]:[page # of description] (type species: *Genus species* Author, year, designation method)

**[species]** **[subspecies]** [Author], [year]:[page # of description] [*original genus*] [distribution]

[*synonym*] [Author], [year]:[page # of description] [*original genus*]

Numerous authors have published more than one article in a single year which may create confusion when bibliographic citations are given. This author has attempted to indicate the publications in a sequential system such as Pic, 1926a; Pic, 1926b; etc. Due to difficulty in establishing actual publication dates, there are cases when the assignments of an "a", "b", "c", etc. after the publication year have been arbitrary. In a perfect cataloging system, a complete worldwide

## LONGHORNED BEETLES OF BORNEO

bibliography for longhorned beetles would exist with all works listed under each author chronologically.

Yearly, the number of species known from Borneo increases. A formal publication of this catalog is not anticipated in the near future since it would be quickly out-of-date. Posting this work on the Internet is more practical until more of the major groups of Bornean longhorned beetles can be studied and revised.

### Acknowledgements

My sincere appreciation is extended to Mr. Steven Bosuang (formerly Steven Chew) for the opportunity to examine many interesting and unique specimens from Sabah, that have led to the description of almost 200 new species in the last 15 years. I thank Mr. Carolus Holzschuh for providing or verifying identifications for hundreds of Bornean species. The following people in Sabah are acknowledged for providing permits, property access and other assistance to Steven Bosuang: Mr. Petin Kilou, District Forestry Officer of Nabawan, Sabah Forestry Department; Mr. Hiroshi Nomura, President, Jusco Travel in Sabah; Dr. Lee Ying Fah, Deputy Director of Sabah Forestry Department and Head of the Forest Research and Diversity Centre, Sepilok; and Dr. Laurentius Nayan Ambu, Director, Sabah Wildlife Department, Kota Kinabalu.

This catalog required assistance from many professional and non-professional colleagues. I wish to acknowledge the help from all of the following:

### Tribe **Acanthocinini**

**Nyssodrysternum** Gilmour, 1960  
**borneanus** Breuning, 1970h:487 [*Pseudoleiopus*] South America {Note 44}

## Catalog Notes

- 1) Some varieties described by various authors, especially Breuning, may not be available names per ICZN rules. The current scope of this catalog does not attempt to clarify this matter.
- 2) Makihara (1999) lists *Spinopterolophia feai* Breuning, but no taxa by that name has been located in the literature. *S. pterolophioides* occurs in Sumatra.
- 3) Neither *Heteropalpoides* Fisher, 1935c:617 or *Heteropalpoides aberrans* Fisher, 1935c:618 are listed in Breuning's catalogue. Tribal placement is undetermined at present.
- 4) *Elacomia histrionica* (Pascoe) was described from Macassar (Sulawesi). Vives & Abang (2003) reported this species from Borneo and West Malaysia. The presence of this small lepturine on both sides of Wallace's Line seems unlikely. Possibly, the type locality is erroneous.
- 5) Recorded from Borneo by Makihara (1999).
- 6) Recorded from Borneo by Makihara (1999) with questionable identification.
- 7) Based on tentative identification. Specimens of *Oplatocera*, from Sabah, which were examined by Mr. Holzschuh, are not *O. shibatai*, but are possibly *O. chujoi*. Since Mindanao and Borneo have very few species in common, it is possible that the species from Sabah is a new taxa. There is also a good probability that *O. shibatai* will be found elsewhere in Borneo, but for now I prefer to exclude it from the fauna.
- 8) Unidentified species recorded by Makihara (1999).
- 9) This record is from Hayashi, 1975:183.
- 10) Deleted.
- 11) This species was reported from Sabah, Borneo by Vives & Heffern (2001). Later, Vives (2003) described *Metalloleptura ohbayashii* based on these specimens.
- 12) Aurivillius (1922) validly introduced the name "*shelfordi*" for a species illustrated in Gahan (1902) in Shelford, which was identified as "*Cylindrepomus* ? form of *comis* (Pasc)"

## LONGHORNED BEETLES OF BORNEO

- 13) *Callophora* was introduced as a replacement name by J. Thomson, 1864, who incorrectly concluded that *Oplophora* Hope, 1839, was pre-occupied by *Oplophorus* Milne-Edwards, 1837, Crustacea: Decapoda.
- 14) Breuning's catalogue (Part 4, 1961) and index (Part 10, 1967) list *Cylindrothorax* in place of *Cylindrostyrax*. Breuning also used the names *Cylindrostyrax* and *Cylindrothorax* somewhat interchangeably in his Revision of Pteropliini, part II (1963). *Cylindrothorax* is an African genus of Sternotomini. Makihara's book lists *Desisa apomecynoides* as a valid species. However this is possibly a result of the confusing error in Breuning's catalogue.
- 15) Dejean (1835) authored the genus-group name *Polyzonus* and listed multiple species within the genus. Laporte (1840), in *Histoire Naturelle des Insectes Coléoptères*, listed only *Polyzonus fasciata* as a member of the genus. Laporte's action does not constitute a type species designation, and thus the statement by Bentanachs (2012) attributing the designation of the type species of *Polyzonus* Dejean to Laporte (1840) is not correct.
- 16) Reported from Sarawak by Abang (2003). Presumably misidentified.
- 17) Lacordaire (1872, p. 587) based the new genus, *Vocula*, on two species: *V. guttifera* and *V. irrorata*. The earliest type species designation which the author has located was in the Palaearctic Catalog of 2010.
- 18) The genera listed here for Rhodopini are from Breuning (1975b and 1976j).
- 19) This species was transferred to *Chlorophorus* (Dauber & Hawkeswood, 1993). It has subsequently been listed in *Xylotrechus* (Makihara, 1999). Dr. Dauber (pers. comm., 2011) prefers placing it in *Xylotrechus*.
- 20) *Callophora* J. Thomson, 1864, was revalidated by N. Ohbayashi, Ogawa & Su (2009).
- 21) Offered by insect dealers, reportedly from Borneo, however, pictures indicate that the specimen is a female of *Neosarmyds costipennis* Fisher, 1935c. There are no literature records for *Emphiesmenus* in Borneo.
- 22) Subsequently Breuning (1939a:471) stated that the type species of *Pseudancylus* Breuning, 1935g, was *Anancylus birmanicus* Breuning, 1935g. This is in opposition to his original designation of type species: *Ereis albofasciatus* Pic, 1925b.
- 23) *Glenea* Newman, 1842, currently does not have a valid type species designation. *Glenea* is a replacement name for *Sphenura* Dejean, as explained in Bousquet, et. al.(2009, p. 37). Invalid designations include the following:
  - a) *Glenea delia* J. Thomson, 1860 (= *Saperda elegans* Olivier, 1795) designated by J. Thomson, 1860
  - b) *Saperda novemguttata* Guérin-Méneville, 1831, designated by Aurivillius, 1920
  - c) *Saperda novemguttata* Guérin-Méneville, 1831, designated by Breuning, 1956
  - d) *Glenea lepida* Newman, designated by ????
- 24) J. Thomson (1864) designated *Ropica incana* Pascoe as type species for *Ropica* Pascoe, however, this species was not among those species originally included with the original description of *Ropica*. The earliest valid type species designation known to this author is Gressitt, 1951b:490.
- 25) Deleted.
- 26) *Pseudoleptura* Thomson, 1861a, was proposed as a replacement for *Erythrus* White, 1853a, a junior homonym of *Erythrus* Walker (in Curtis, 1830). However, *Erythrus* Walker was proposed in a catalogue and the two species associated with it were *nomina nuda*. Therefore the name *Erythrus* Walker (in Curtis, 1830) is a *nomen nudum* (no description or available species associated with it) and so there is no need for a replacement name.
- 27) Makihara (1999) recorded and illustrated *Megopis kollerii* Lameere from Kalimantan. The correct identity of the specimen in the photograph (fig. 10) is *Megobaralipon kalimantanum* (Komiya & Makihara) (Z. Komiya pers. comm.).
- 28) Breuning probably intended to name this species "*roseolata*", based on his description. The actual spelling as published is "*reseolata*".
- 29) Refer to Chou & Ohbayashi (2008) for tribal placement discussion.
- 30) Pascoe (1866a:515) states that this is possibly the same species as *H. morosus* (Pascoe).

## LONGHORNED BEETLES OF BORNEO

- 31) *Ceresium zeylanicum* has been reported from many locations, including SE Asia. According to C. Holzschuh, pers. comm., its actual range is probably limited to Sri Lanka and India, with records from other areas likely being similar or undescribed species in the genus.
- 32) This species was listed in the 2005 version of this checklist. Bornean specimens of this genus were described recently (2009) as *Anameromorpha pollinosa* Holzschuh.
- 33) Per Yamasako & Makihara (2011), authorship of *Golsinda* is attributed to Pascoe, however the year of publication is 1856, not 1857, as mentioned in their article. Designation of the type species of *Golsinda* was unintentionally made by Pascoe (1862) when he excluded all other species from *Golsinda*, except *G. corallina*.
- 34) This species was described from Sumatra. In Breuning's catalogue (1962, p. 388), he cites this species from only Borneo. This is apparently an error in Breuning's catalogue. Certainly, this species could occur on Borneo.
- 35) There are numerous undescribed species in this genus.
- 36) The genus is not monotypic and the type species was not designated in the original description. The subsequent designation of type species is the first valid designation that this author is aware of, however, there may be other works in which a type species was designated. It has not been possible to make a complete survey of all literature to check for such designations.
- 37) According to C. Holzschuh (pers. comm.), in Makihara (1999), the species illustrated as *Xoanodera regularis* Gahan, 1890 is not correct; the species illustrated as *X. striata* Gressitt & Rondon, 1970, is probably incorrect; the species illustrated as *X. trigona javana* is probably *X. subdita* Holzschuh; the species illustrated as *X. vitticollis* is actually *X. interrupta* Pic.
- 38) According to Holzschuh (pers. comm.), *Prothema fasciolata* Aurivillius and *Prothema plagifera* Aurivillius are the same species. The type of *P. fasciolata* is female and the type of *P. plagifera* is male.
- 39) *Olenecamptus bilobus* is widespread across this region and is variably marked leading to the description of many subspecies. Whether any subspecies should be recognized is arguable.
- 40) In the original description, the type locality was incorrectly cited as "Burma". According to C. Holzschuh, who has examined the holotype, the label reads "Borneo"
- 41) Specimen(s) in the collection of Heffern, Holzschuh, Komiya and/or Vives.
- 42) Specimens from Borneo are tentatively identified based on description, but not compared to type from Laos.
- 43) Previous report of *Leptosiella parallela* (Ritsema) from Borneo by Morati & Huet (2004a) was based on a misidentification of a species which was undescribed at that time.
- 44) *Pseudoleiopus borneanus* Breuning was apparently described from a mislabeled specimen. This is a widely scattered neotropical species (Monné and Machado, 2009).
- 45) *Ceresium femoratum* Aurivillius was recorded from Sabah by Fisher (1935). The type locality is in the Philippines (Sibuyan). There are currently numerous undescribed species from Borneo and Fisher's record of this Philippine species is doubtful.
- 46) Pascoe (1866b:303) described the genus *Diochares* and listed three species following the generic description: *fimbriatus* Olivier, 1792; *lugubris* n. sp; and *impluviatus* n. sp. Pascoe stated "the type was described long ago by Olivier" without specifically mentioning *fimbriatus*, however his intent was clear that he was designating a type species, since only one of the three species of the new genus, *Diochares*, was described by Olivier. Löbl (2010) stated that the type species "was apparently not fixed", and subsequently designated *Cerambyx fimbriatus* Olivier, 1792, whether this was absolutely necessary is arguable, depending on interpretation of ICZN rules.
- 47) *Caraphia* is placed outside of the named tribes of Lepturinae based on Chou & Ohbayashi, 2008:138-139.
- 48) An earlier type species designation may exist.
- 49) Breuning's revision of *Glenea* lists this subspecies under *G. voluptuosa*, not *G. subsimilis*.
- 50) In Thomson (1865, p. 565) he notes "Dej Cat 1837, p 376". This has not been researched to determine if Dejean was the author of "*angerona*".

## LONGHORNED BEETLES OF BORNEO

- 51) Pascoe (1866a:260) stated that this name was to replace "*pulchella* Hope".
- 52) Subgenera of *Glenea* require a re-evaluation to determine if they should be elevated to full generic status. Recently, Vives (2005b) elevated *Acronioglenea* Breuning, 1974, to full generic status. Likewise, Lin, Montreuil, Tavakilian and Yang (2009) reinstated *Heteroglenea* Gahan, 1897 as a valid genus.
- 53) *Clytellus* is a genus of very small species which have been included in the Tillomorphini (Gressitt & Rondon, 1970).
- 54) *Psebena*, a genus of only two small-medium species, was originally placed in Necydalinae by Gahan (1902) and recently considered to be related to Thraniini (Vives, 2006). It's affinities are very questionable.
- 55) Records for this species may eventually be shown to apply to a new or another described species.
- 56) Placement of this genus into Xylosteini is in accordance with the Palaeartic Catalog (2010).
- 57) All listed species are placed in *Merionoeda* s. str. pending ongoing studies by Dr. Niisato and his colleagues.
- 58) This species was listed in the 2005 version of this checklist. The author cannot verify that this species occurs outside of the Philippines, and there is also a record for Buru (island near New Guinea).
- 59) Niisato (1990) listed *Comusia* in Obriini. Previously, Gressitt & Rondon (1970) listed it in Oemini.
- 60) Makihara (1999) has misidentified this species.
- 61) Fabricius's *Entomologia systematica* was published in two parts with the date 1792 indicated on the title page of the first part. The section on Cerambycidae was published May 4, 1793 (Evenhuis, 1997:248)
- 62) Lacordaire's Volume 8 is dated 1869, however the volume was published in November, 1868.
- 63) ICZN Article 67.4.1.
- 64) *Chlorophorus moultoni* Aurivillius, 1911 is possibly a synonym of *C. lituratus* (Laporte & Gory, 1836).
- 65) Recorded from Borneo by Makihara & Noerdjito, 2004.
- 66) Recorded from Borneo by Yokoi & Niisato, 2009b.
- 67) Breuning did not specify a valid type species when he described *Parepilysta* (1939b:243). Later (Breuning, 1964i:88) designated *P. strandi* Breuning, 1939b as the type species.
- 68) Breuning incorrectly spelled *Glenea baia* Jordan, 1903a, as *Glenea baja* Jordan, 1903a, in his work on *Glenea* and in his catalog.
- 69) This species was reported from Borneo by Vives (2001:7). The correct name for these specimens is *Stenoleptura levicula* Holzschuh, 2011.
- 70) Recorded from Sarawak by Abang (2003).
- 71) This genus does not belong in Tillomorphini.
- 72) This has been considered to be in Thraniini.
- 73) This has been considered to be in Oemini. A specimen in the author's collection from Sabah is very similar to the holotype and is considered to be the same species despite the fact that the type locality is Sulawesi.
- 74) This author follows the analysis and comments presented in Santos-Silva & Galileo (2010) regarding the classification of Macrotomini: "It is probable that Macrotomini is not a monophyletic group, but the divisions proposed up to now are inconsistent. Thus, we believe that the prudent action is to maintain Macrotomini as a single tribe, including and disregarding the subdivisions presented in Lameere (1919)." Various on-line catalogs and the Palaeartic Catalog of Löbl, I. & A.Smetana (eds). (2010), continue to use the classification presented nearly a century ago.
- 75) It is currently outside the scope of this catalog to allocate all of these genera to their appropriate tribe.
