

A review of the genus *Mononchoides* Rahm, 1928, with description of two new species from European Russia (Nematoda: Diplogasterida)

V.G. Gagarin

Gagarin, V.G. 1998. A review of the genus *Mononchoides* Rahm, 1928, with description of two new species from European Russia (Nematoda: Diplogasterida). *Zoosystematica Rossica*, 7(2): 229-238.

A description of the genus *Mononchoides* Rahm, 1928, a list of species with their synonyms and a key to species are given. The following new synonymies are established: *Mononchoides* Rahm, 1928 = *Glauxinema* Algen, 1947; *M. americanus* (Steiner, 1930) = *M. adjunctus* Massey, 1966; *M. andrassyi* (Timm, 1961) = *M. andersoni* Ebsary, 1986. *Diplogaster* (*Eudiplogaster*) *elegans* Weingärtner, 1955 and *D. (E.) leptospiculum* Weingärtner, 1955 are considered as *species incertae sedis*. *Mononchoides paramonovi* sp. n. and *M. microstomus* sp. n. found in saprobios in Yaroslavl' Prov. of Russia are described and illustrated.

V.G. Gagarin, Institute of Inland Waters Biology, Russian Academy of Sciences, Borok 152742, Yaroslavl' Prov., Russia.

Introduction

The genus *Mononchoides* was established by Rahm (1928) for the species *Mononchoides longicauda*. Rahm considered as main morphological characteristics of this genus the following ones: (a) division of buccal cavity into two parts, of which the posterior part is prismatic; (b) dorsal tooth large, claw-like, mobile. Paramonov (1952) had erected the genus *Eudiplogaster* with similar morphological characteristics. Goodey (1963) extended and emended the diagnosis of the genus *Mononchoides* and listed 10 species in this genus. He synonymized *Eudiplogaster* Paramonov, 1952 with *Mononchoides* Rahm, 1928. Some nematologists (Callaway & Tarjan, 1973; Gagarin, 1983; Andrassy, 1984; Ebsary, 1986) emended the diagnosis of the genus and revised the list of included species. We examined morphological characteristics and systematics of the genus *Mononchoides* using published data (Körner, 1954; Weingärtner, 1955; Andrassy, 1958; Meyl, 1961; Paramonov, 1964) and extensive original material of the species *M. intermedius* Gagarin, 1993, *M. paramonovi* sp. n., and *M. microstomus* sp. n.

Genus *Mononchoides* Rham, 1928

Syn.: *Diplogaster* subg. *Loxolaimus* Rahm, 1928; *Loxolaimus*: Sch.Stekhoven, 1951; *Glauxinema* Algen, 1947, syn. n.; *Eudiplogaster* Paramonov, 1952; *Diplogaster* subg. *Eudiplogaster*: Weingärtner, 1955; *Tridontus* Khera, 1965.

Type species *Mononchoides longicauda* Rahm, 1928.
Diagnosis. Neodiplogasterinae. Body length 0.6-3.4 mm. Males smaller and slenderer than females. Cuticle thin, with fine transverse striae and longitudinal ridges. Transverse striae arising from pointed sclerotia; longitudinal ridges formed by larger sclerotia: lines, ribs, and staves. Ridges 14-40 in number, but usually 20-26 (Table 1). They stretch along the body from head to tail base. Head continuous with body. Front edge of head flattened. No lips; lip tubercles present. 6 setiform labial papillae arranged around oral opening. Papillae length 1-8 µm. Males, in addition, have 4 setiform papillae placed behind the former ones. Amphids slit-like, at level of metastomal teeth. Buccal cavity (stoma) divided into two parts: broader anterior part, composed of cheilo-, promeso- and metarhabdions, and narrower posterior part, composed of telorhabdions only. Length of stoma usually greater than

Table 1. Measurements of species of the genus *Mononchoides*.

width of head. Cheilostoma spacious, barrel-shaped; its walls strengthened with 12-18 strongly cuticularized, curved ribs. Apical ends of ribs bifurcated. Metastoma bearing teeth and a transverse plate. Dorsal metarhabdion with large, claw-like, mobile, strongly cuticularized tooth bifurcated at apex. Right subventral metarhabdion with pyramidal or thorn-like, immovable, weakly cuticularized, badly seen tooth. Left subventral metarhabdion with weakly cuticularized, single plate, upper edge of which is serrate, rarely smooth. Telostoma always in the form of three-side prism, with 1-2 small onchia at base, sometimes of equal length and width, but usually 1.5-2.0 times as long as wide. Oesophagus slender, 11-25% of total body length, sharply divided into two sections: anterior muscular section (procorpus and median bulb) and posterior glandular section (isthmus and basal swelling). Anterior section of oesophagus longer than posterior section, except for *M. schwemmlei* and *M. splendidus*, in which anterior and posterior sections are of equal length (Table 1). Females didelphic, amphidelphic, with amphidromous ovaries. Vulva in most species before middle of body ($V = 26\text{-}49\%$). Postequatorial vulva ($V = 51\text{-}65\%$) rarely occur. Testis simple, bent. Spicules separate, slender, slightly curved, with handle-like capituli. Gubernaculum curved, thin; its proximal end smoothly rounded, claw-like, often with dent; apical end often with "muff", which comprises ends of spicules. Bursa small, rudimentary. Sexual setiform papillae in number of 9-10 pairs: 3 pairs precloacal and 6-7 pairs postcloacal (caudal). Tail long, with filiform terminus in both sexes. Female tail usually longer than distance between vulva and anus and at least 10 times as long as anal body diameter (Table 1). Tail usually shorter in male than in female. Free-living, predatory nematodes usually inhabiting saprobios.

In two species, *M. elegans* (Weingärtner, 1955) and *M. leptospiculum* (Weingärtner, 1955), the values of "V" equal 51-61(56)% and 54-62(58)% respectively. The distance between vulva and anus is 0.108 times the distance between posterior end of oesophagus and vulva and 1.7 times the body width in *M. elegans*, and 0.214 and 2.1 times in *M. leptospiculum*. These species have only one, anterior ovary, that contradicts to the diagnosis of the genus *Mononchooides* (females didelphic, amphidelphic). Consequently, the species *Diplogaster (Eudiplogaster) elegans*

Weingärtner, 1955 and *Diplogaster (Eudiplogaster) leptospiculum* Weingärtner, 1955, placed by Goodey (1951) and Andrassy (1984) in the genus *Mononchooides*, are regarded as *species incertae sedis*.

List of species

M. americanus (Steiner, 1930) Chitwood & Chitwood, 1937. Syn.: *Diplogaster americana* Steiner, 1930; *Diplogaster (Eudiplogaster) americana* (Steiner, 1930) Weingärtner, 1955; *Eudiplogaster americana* (Steiner, 1930) Paramonov, 1952; *Glauxinema americanum* (Steiner, 1930) Andrassy, 1984; *Mononchooides adjunctus* Massey, 1966, syn. n.

M. andrassyi (Timm, 1961), comb. n. Syn.: *Diplogaster (Eudiplogaster) andrassyi* Timm, 1961; *Eudiplogaster andrassyi* (Timm, 1961) Timm, 1961; *Glauxinema andrassyi* (Timm, 1961) Andrassy, 1984; *Mononchooides anderssoni* Ebsary, 1986, syn. n.

M. armatus (Hofmänner, 1913), comb. n. Syn.: *Diplogaster armata* Hofmänner, 1913; *Eudiplogaster armata* (Hofmänner, 1913) Paramonov, 1952; *Fictor armatus* (Hofmänner, 1913) Goodey, 1963; *Glauxinema armatum* (Hofmänner, 1913) Andrassy, 1984; *Diplogaster aphodii* Bovien, 1937; *Diplogaster (Eudiplogaster) aphodii* (Bovien, 1937) Weingärtner, 1955; *Eudiplogaster aphodii* (Bovien, 1937) Meyl, 1961; *Prosodontus aphodii* (Bovien, 1937) Paramonov et al., 1954; *Glauxinema aphodii* (Bovien, 1937) Andrassy, 1984.

M. bollingeri Goodrich et al., 1968.

M. filicaudatus (Allgen, 1947) Andrassy, 1984. Syn.: *Glauxinema filicaudatum* Allgen, 1947.

M. flagellicaudatus (Andrassy, 1962), comb. n. Syn.: *Eudiplogaster flagellicaudata* Andrassy, 1962; *Glauxinema flagellicaudatum* (Andrassy, 1962) Andrassy, 1984.

M. fortidens (Sch.Stekhoven, 1951) Taylor & Hechler, 1966. Syn.: *Diplogaster fortidens* Sch. Stekhoven, 1951.

M. gracilis Dassonville & Heyns, 1984.

M. intermedius Gagarin, 1993.

M. longicauda Rahm, 1928.

M. longicaudatus (Khera, 1965) Andrassy, 1984. Syn.: *Tridontus longicaudatus* Khera, 1965.

***M. microstomus* sp. n.**

***M. paramonovi* sp. n.**

M. parastriatus (Paesler, 1936) Andrassy, 1984. Syn.: *Diplogaster parastriata* Paesler, 1936; *Diplogaster isolae* Meyl, 1953; *Diplogaster (Eudiplogaster) isolae* (Meyl, 1953) Meyl, 1954; *Eudiplogaster isolae* (Meyl,

1953) Meyl, 1961; *Mononchoides isolae* (Meyl, 1953) Goodey, 1963.

M. pulcher Zullini, 1980.

M. pylophilus (Weingärtner, 1955) Goodey, 1963. Syn.: *Diplogaster (Eudiplogaster) pylophila* Weingärtner, 1955; *Eudiplogaster pylophila* (Weingärtner, 1955) Andrassy, 1958.

M. rhabdoderma (Völk, 1950) Calawey & Tarjan, 1973. Syn.: *Diplogaster rhabdoderma* Völk, 1950.

M. ruffoi Zullini, 1950.

M. schwemmlei (Sachs, 1950), comb. n.

Syn.: *Diplogaster schwemmlei* Sachs, 1950; *Diplogaster (Eudiplogaster) schwemmlei* (Sachs, 1950) Weingärtner, 1955; *Eudiplogaster schwemmlei* (Sachs, 1950) Paramonov, 1952; *Prosodontus schwemmlei* (Sachs, 1950) Goodey, 1963; *Glauxinema schwemmlei* (Sachs, 1950) Andrassy, 1984.

M. splendidus (Körner, 1954) Goodey, 1963. Syn.: *Diplogaster (Eudiplogaster) splendida* Körner, 1954; *Eudiplogaster splendida* (Körner, 1954) Andrassy, 1958; *Glauxinema splendidus* (Körner, 1954) Andrassy, 1984.

M. striatus (Bütschli, 1876) Goodey, 1963. Syn.: *Diplogaster striata* Bütschli, 1876; *Diplogaster (Eudiplogaster) striata* (Bütschli, 1876) Weingärtner, 1955; *Eudiplogaster striata* (Bütschli, 1876) Paramonov, 1952; *Diplogaster paesleri* Gunhold, 1952; *Koerneria paesleri* (Gunhold, 1952) Meyl, 1961.

M. subdentatus (Gunhold, 1952) Andrassy, 1984. Syn.: *Diplogaster subdentata* Gunhold, 1952; *Koerneria subdentata* (Gunhold, 1952) Meyl, 1961; *Diplogaster (Eudiplogaster) histophora* Weingärtner, 1955; *Eudiplogaster histophora* (Weingärtner, 1955) Andrassy, 1958; *Mononchoides histophorus* (Weingärtner, 1955) Goodey, 1963.

M. trichuris (Cobb, 1893) Goodey, 1963. Syn.: *Diplogaster trichuris* Cobb, 1893; *Glauxinema trichuris* (Cobb, 1893) Andrassy, 1984.

The species *Mononchoides elegans* (Weingärtner, 1955) Goodey, 1963 and *Mononchoides leptospiculum* (Weingärtner, 1955) Goodey, 1963 are regarded as *species inquirendae*.

Key to species of *Mononchoides*

1(10). Body length 1.0 mm or less.

2(7). Tail shorter than distance between vulva and anus; $c' = 10$ or less.

3(4). Anterior section of oesophagus twice as long as its posterior section; $c' = 10$... **M. americanus**

4(3). Anterior section of oesophagus not more than 1.5 times as long as its posterior section; $c' = 4-7$.

- 5(6). Telostoma 2.5 times as long as wide; $V = 55-57\%$, $c' = 4$ **M. schwemmlei**
- 6(5). Telostoma as long as wide; $V = 41-48\%$, $c' = 6-7$ **M. subdentatus**
- 7(2). Tail longer than distance between vulva and anus; $c' = 15$ or more.
- 8(9). $L = 1.0$ mm; $c' = 15$ **M. filicaudatus**
- 9(8). $L = 0.9$ mm; $c' = 20$ **M. flagellicaudatus**
- 10(1). Body length 1.0 mm or more.
- 11(22). Tail twice as long as distance between vulva and anus.
- 12(15). Anterior section of oesophagus at least twice as long as its posterior section.
- 13(14). $L = 1.0-1.5$ mm; 24-26 longitudinal ridges at cuticle **M. paramonovi** sp. n.
- 14(13). $L = 1.5-1.6$ mm; 30-34 longitudinal ridges at cuticle **M. pulcher**
- 15(12). Anterior section of oesophagus not more than 1.8 times as long as its posterior section.
- 16(17). $V = 52-65\%$ **M. longicauda**
- 17(16). $V = 50\%$ or less.
- 18(19). $c' = 24$; 22-24 longitudinal ridges at cuticle **M. fortidens**
- 19(18). $c' = 30$; 39-40 longitudinal ridges at cuticle.
- 20(21). Tail 3.2 times as long as distance between vulva and anus; telostoma 1.5 times as long as wide **M. trichuris**
- 21(20). Tail twice as long as distance between vulva and anus; telostoma twice as long as wide **M. bollingeri**
- 22(11). Tail not more than 1.8 times as long as distance between vulva and anus.
- 23(24). Tail shorter than distance between vulva and anus **M. armatus**
- 24(23). Tail longer than distance between vulva and anus.
- 25(28). Anterior section of oesophagus twice as long as its posterior section.
- 26(27). $c' = 20-26$; 24-26 longitudinal ridges at cuticle **M. microstomus** sp. n.
- 27(26). $c' = 15-19$; 20 longitudinal ridges at cuticle **M. parastriatus**
- 28(25). Anterior section of oesophagus not more than 1.8 times as long as its posterior section.
- 29(36). $c = 7-15$.
- 30(33). Length of spicules 40 μm or more.
- 31(32). Tail 1.6 times as long as distance between vulva and anus; telostoma 1.8 times as long as wide **M. rhabdoderma**
- 32(31). Tail 1.1 times as long as distance between vulva and anus; telostoma 1.1-1.2 times as long as wide **M. striatus**
- 33(30). Length of spicules 35 μm or less.
- 34(35). $V = 56-64\%$; spicules 24 μm long **M. pylophilus**
- 35(34). $V = 40-41\%$; spicules 35 μm long **M. intermedius**
- 36(29). $c' = 16-30$.
- 37(38). Spicules 50-55 μm long **M. gracilis**
- 38(37). Length of spicules 49 μm or less.
- 39(40). Anterior section of oesophagus as long as its posterior section **M. splendidus**
- 40(39). Anterior section of oesophagus longer than its posterior section.

- 41(42). Tail 1.9 times as long as distance between vulva and anus; spicules 25 μm long *M. longicaudatus*
 42(41). Tail 1.5 times as long as distance between vulva and anus; length of spicules 30 μm or more.
 43(44). 20 longitudinal ridges at cuticle: telostoma twice as long as wide *M. andrassyi*
 44(43). 28 or more longitudinal ridges at cuticle; telostoma not more than 1.7 times as long as wide.
 45(46). 40 longitudinal ridges at cuticle; spicules 48-49 μm long *M. changi*
 46(45). 28-30 longitudinal ridges at cuticle; spicules 30-35 μm long *M. ruffoi*

Mononchoides paramonovi sp. n.

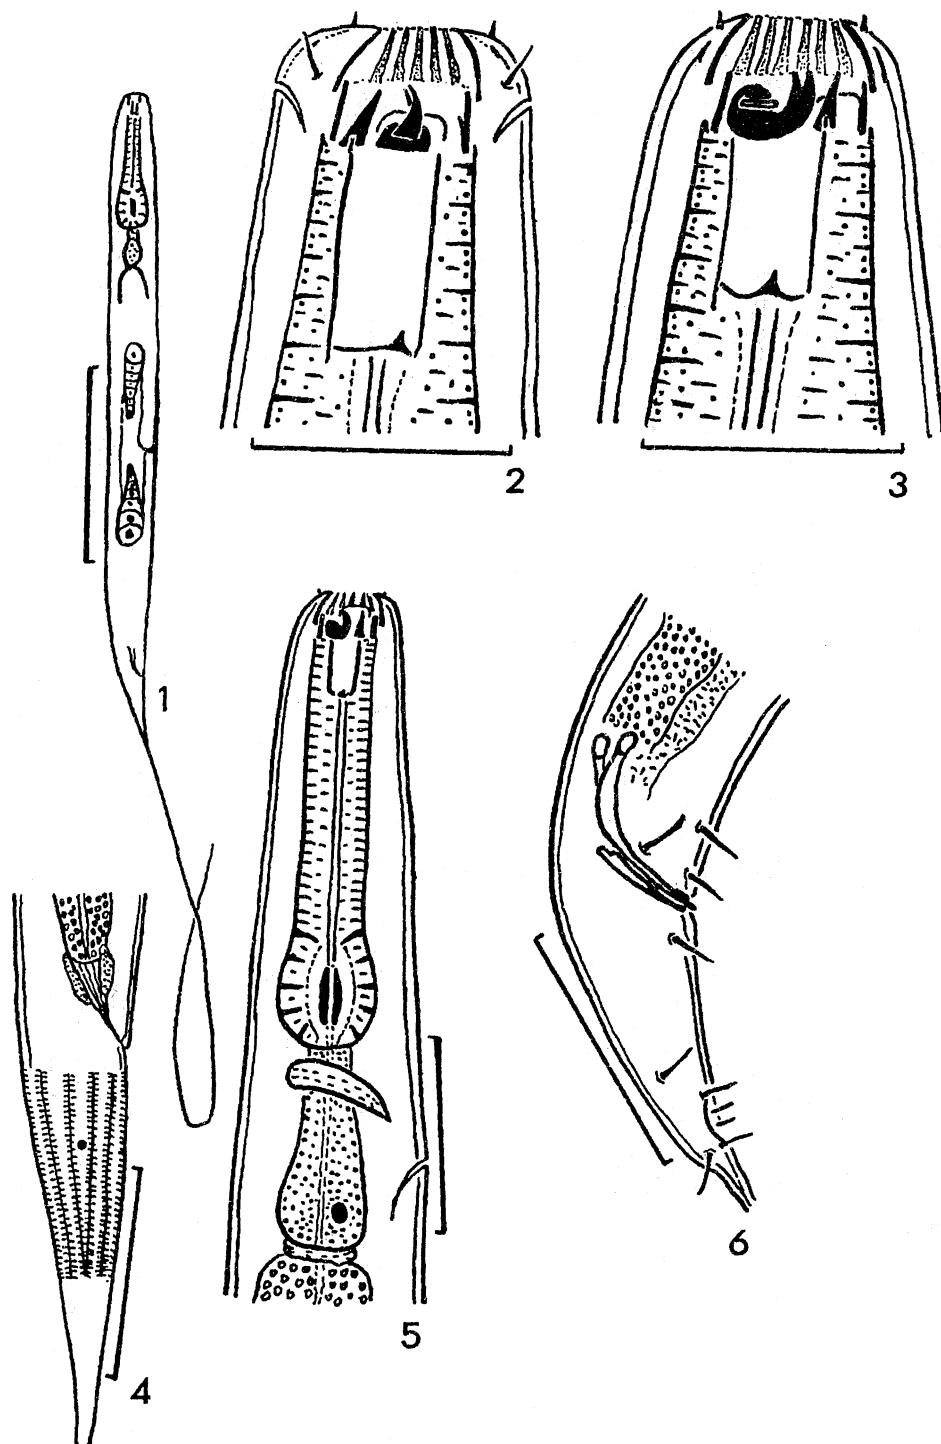

(Figs 1-6)

Holotype. ♀, Russia, Yaroslavl' Prov., settlement Borok, cow manure, 30.VII.1997, slide No. 71/73, Institute of Parasitology, Russian Academy of Sciences, Moscow.

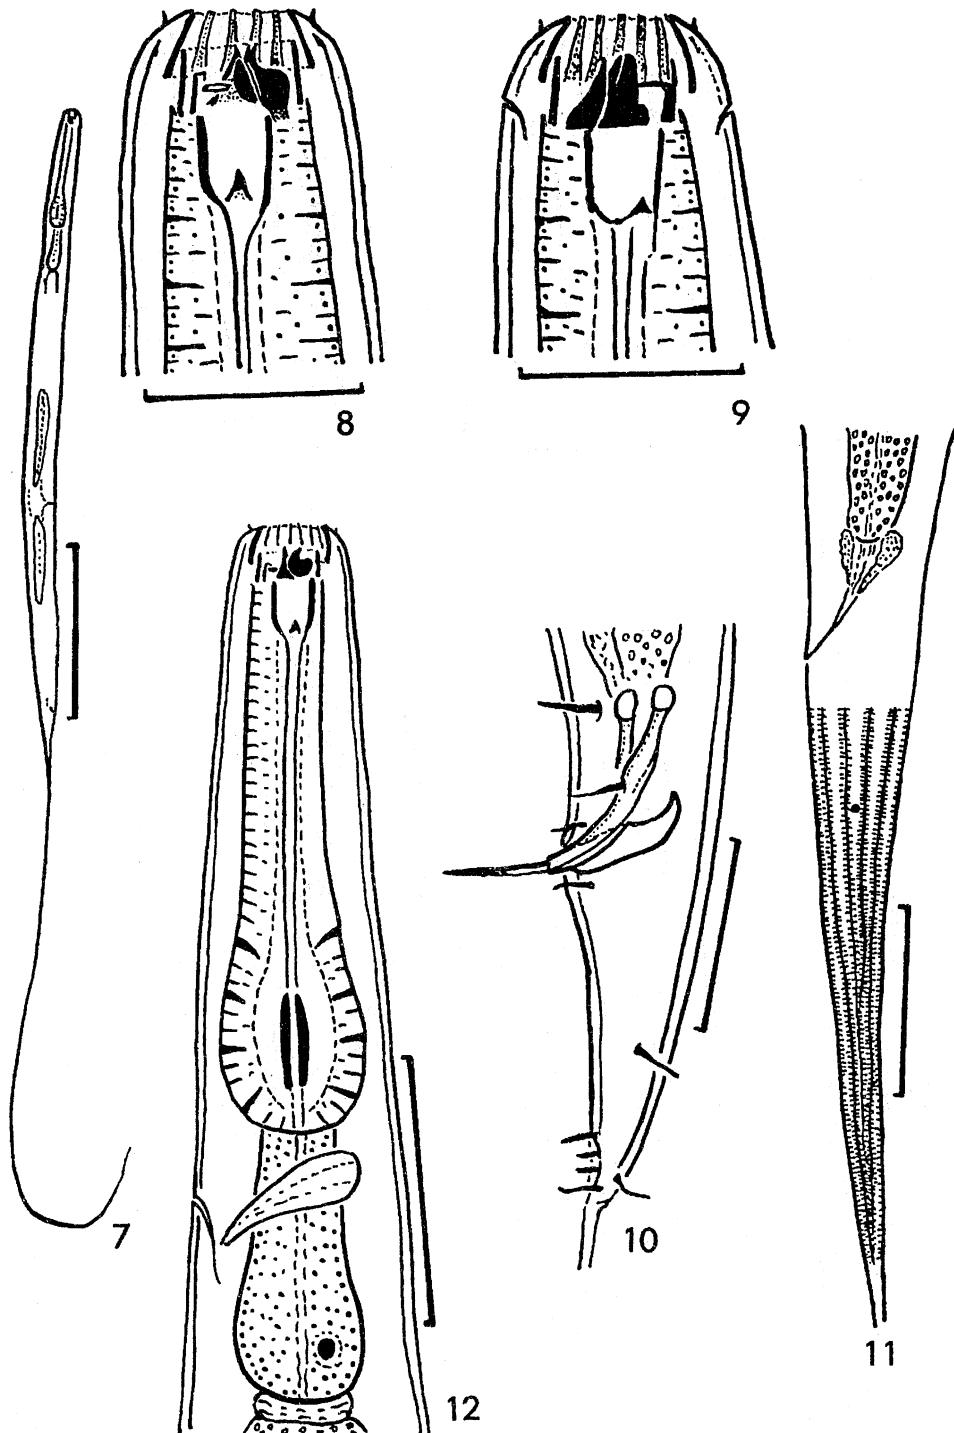

Paratypes. 6 ♀, 8 ♂, collected with holotype; 3 ♀, 6 ♂ from silo; 13 ♀, 7 ♂ from humus.

Measurements. Holotype ♀: L = 1280 μm , a = 29, b = 8.0, c = 1.8, c' = 25.5, V = 26.3%. Paratypes: see Table 2.

Description. Cuticle thin, its thickness in vulva region about 1.0 μm . Cuticle with transverse striation, with 24-26 longitudinal ridges. Ridges formed by pairs of short lines. Front end of head flattened. Head width in females 16-21, in males 14-18 μm . Lips absent. Labial papillae setiform. 6 labial papillae, 2.5-3.0 μm long, arranged around oral opening. In males, 4 additional papillae, about 5 μm long, situated behind the former. Total stoma length in females 22-26, in males 16-21 μm . Telostoma distinctly longer than upper cavity of stoma, prismatic, approximately twice as long as wide. One small onchium in telostoma base. Cheilostoma barrel-shaped, its walls with 12 strongly cuticularized curved ribs. Dorsal tooth large, mobile, claw-like, its apical end bifurcated.

Figs 1-6. *Mononchoides paramonovi* sp. n. 1, general view of female; 2, male head in lateral view; 3, female head in ventral view; 4, tail of female; 5, oesophagus of female; 6, tail of male. Scales: 200 µm (1), 50 µm (4-6), 20 µm (2, 3).

Figs 7-12. *Mononchoides microstomus* sp. n. 7, general view of female; 8, female head in lateral view; 9, female head in ventral view; 10, oesophagus of female; 11, tail of male; 12, tail of female. Scales: 200 µm (7), 50 µm (10), 25 µm (8, 9, 11, 12).

Right subventral tooth pyramidal, immovable, badly visible. Left subventral plate weakly cuticularized, serrate or, rarely, smooth. Amphids slit-like, situated at level of metastomal teeth. Body at proximal end of oesophagus 2.0-2.5 times as wide as head. Anterior section of oesophagus 2.0-3.0 times as long as its posterior section. Excretory pore situated at level of nervous ring. Vulva slit-like, preequatorial. Vulva lips weakly cuticularized, not protruded. Vagina oblique, shorter than corresponding body diameter. Usually 1-2 eggs in uterus, size 65-77 × 45-53 µm. Testis simple. Spicules slender, ventrally curved, with large, rounded heads. Spicules 1.5-1.8 times as long as anal body diameter. Gubernaculum about half as long as spicules, thin, its proximal end with small dent, apical end with "muff". Bursa strongly rudimentary. Sexual papillae of males setiform, 5.5-7.0 µm long, 10 pairs in number: 3 pairs precloacal and 7 pairs postcloacal. Tail long, with filiform terminus in both sexes.

Comparison. The new species is close to *M. pulcher* Zullini, 1980 and *M. microstomus* sp. n. From the first species, it differs in the number of longitudinal ridges at cuticle (in *M. pulcher* 30-34 longitudinal ridges) and the longer body (in *M. pulcher* L = 1.5-1.6 mm). From the second species it differs in the longer teleostom (in *M. microstomus* sp. n. telostoma 1.0-1.4 times as long as wide) and in the ratio of tail length to distance between vulva and anus (in *M. microstomus* sp. n. tail 1.2-1.5 times as long as distance from vulva to anus).

Etymology. This species is named in honour of the famous Russian nematologist A.A. Paramonov (1891-1970).

Mononchoides microstomus sp.n.

(Figs 7-12)

Holotype. ♀, Russia, Yaroslavl' Prov., settlement Borok, cow manure, 30.VII.1997, slide No. 71/74, Institute of Parasitology, Russian Academy of Sciences, Moscow.

Paratypes. 11 ♀, 6 ♂, collected with the holotype; 10 ♀, 10 ♂ from rotten potatoes.

Measurements. Holotype ♀: L = 1250 µm, a = 24, b = 7.1, c = 2.1, c' = 23.2, V = 34%. Paratypes: see Table 3.

Description. Cuticle about 1.0 µm thick in vulva region, annulated, with 24-26 longitudinal ridges formed by pairs of short lines. Front edge of head flattened. Head width in females 19-23, in males 14-18 µm. 6 setiform papillae 2.5-3.0 µm long, arranged around

oral opening. Males with 4 additional setiform papillae about 5.0 µm long, situated behind the former. Amphids slit-like, located at level of metastomal teeth. Cheilostoma barrel-shaped, with 12 strongly cuticularized, curved ribs. Dorsal tooth large, mobile, claw-like, with bifurcated apical end. Right subventral tooth pyramidal, immovable, hardly seen. Left subventral plate weakly cuticularized, its frontal edge serrate or smooth. Telostoma in the form of three-sides prism, its length, as a rule, equal to its width. One small onchium in telostoma base. Body at proximal end of oesophagus 1.7-2.1 times as wide as head. Anterior section of oesophagus 2.0-2.3 times as long as its posterior section. Excretory pore situated at level of nervous ring. Vulva in the form of narrow slit, preequatorial. Vulva lips weakly cuticularized, not protruded. Vagina oblique, shorter than corresponding body diameter. 1-2 eggs in uterus, size 57-63 × 36-42 µm. Testis simple, bent. Spicules narrow, ventrally curved, with large heads, about 1.5 times as long as anal body diameter. Gubernaculum about twice as long as spicules, thin, its proximal end claw-like, bent, apical end with "muff" comprising ends of spicules. Bursa small, rudimentary. Sexual papillae of males setiform, 5-6 µm long, 10 pairs in number, of which 3 pairs precloacal and 7 pairs postcloacal. Tail long, with filiform terminus in both sexes.

Comparison. The new species is distinguished from the close species *M. parastriatus* (Paesler, 1936) by the fewer longitudinal ridges at cuticle (20 longitudinal ridges in *M. parastriatus*) and shorter tail (c' = 15-19 in females of *M. parastriatus*). From *M. paramonovi* sp. n., it is distinguished by the shorter telostoma (in *M. paramonovi* telostoma 1.8-2.3 times as long as wide) and tail 1.2-1.5 times as long as the distance from vulva to anus (in females of *M. paramonovi*, tail 2.0-3.1 times as long as the distance between vulva and anus).

Etymology. The species name means "having small stoma".
